7th. The separation of intermixed iron from amalgams containing sodium or its equivalent, or from any metal or metals extracted from such amalgams; by magnets, either permanent or electro-magnetic; as above set forth.

8th. The combination with quicksilver, when used in conjunction with iron or other reducing metals, for reducing to an amalgam, silver from its chloride or other compound, or any other metal from any saline compound or solution; of sodium, or other highly electro-positive metal; as above set forth.

* * * * * *

12th. In all cases in which metallic surfaces, such as copper plates, the zincs of voltaic batteries, etc., are to be amalgamated; the use of quicksilver combined with sodium, or other highly electro-positive metal; as above set forth.

13th. The more rapid and convenient application of quicksilver to surfaces with metallic brushes; by virtue of its previous combination with sodium, or other highly electro-positive metal; as above set forth.

14th. The use of metallic brushes, enfilmed with an amalgam of sodium or its equivalent; for incorporating together particles of quicksilver, gold, silver, or any other metal, scattered throughout ores, slimes, or any other materials; as above set forth.

15th. The more convenient transportation, handling and subdivision of quicksilver; by conversion into solid forms; in the manner herein substantially described.

A HEAVY BLAST.—The Nevada *Transcript* says that a blast of three hundred kegs of powder was let off in the Golden Gate claims at North San Juan, one day last week. The claims, as well as all others in that vicinity, require an immense amount of powder to blast the cement which is very hard, and cannot be worked in any other way. This blast shook the whole town, and in a house near by, a man was thrown completely out of his chair, while reading a paper. Considerable damage was done by the breaking up of pipes, hose, flume, etc., in the diggings. Scarcely a piece of this cement can be picked up in the Goldeo Gate claims but what is filled with gold.

THE yew trees of Surrey, England, stood in the days of Julius Cæsar. There is an apple tree in Hartford, Conn., 200 years old. A live oak in Louisiana 1000 years old. A cedar on Mount Lebanon 2,120 years old. A sycamore in the Bosphorus 4,000 years old.

Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

From El Dorado County.

BY OUR TRAVELING CORRESPONDENT.

MESSRS. EDITORS:—Having been detained in the neighborhood of Georgetown much longer than I originally intended, in consequence of the equinoctial storm that had set in when I last wrote, the few short intervals of sunshine intervening, have been spent in an examination of the mines and ledges lying south, embracing a scope of country seven miles in length and two in width, bordering upon Empire, Manhattan, and Johnston creeks, and extending to Kanaka Valley.

The placer mines are not yet entirely worked out, if we may be allowed to judge from the number of claims that still afford a livelihood to a population of some 500, perhaps, within the above limits—one claim (Mr. Russell's) at Garden Valley, paying from $10 to $12 per day to the man.

As to quartz claims, "their name is legion," and all history, ancient and modern, has been ransacked for appropriate cognomens—our late generals coming in for their full share, as well as some of the lucky owners or locators of the same. More or less work had been done upon all, but generally "loss"; very few claims having a shaft over twenty feet in depth; and yet the indications, so far as developments had been made, were all that could be expected or desired, such as lodes of well-defined, lively quartz; free gold in most cases being visible with irregular, auriferous sulphurets, and placer mines in the ravines below them. Indications may be good, but facts and demonstration are better. In some instances, even, it has been demonstrated by sluicing, by the hand-mortar, and by crushing a few tons of the ore, that it will pay well; yet, the work goes out on, or if it moves at all, moves slowly. Why so? Engines for hoisting water and ore are wanted, and mills for crushing, and these require capital.

The first claim visited was

THE EMPIRE,

One mile from town, on the trail leading to Gardea Valley, located a year ago by Messrs. Ingam, Woodside, Kenedy, et als., having a shaft down eleven feet, filled by the recent rains with water, and giving no opportunity of seeing the lode at this point, but as it had been cut by another company some few hundred feet north, I was enabled to form an opinion as to its size, dip, and direction. Its course, like all others afterwards examined, followed the general direction of our mountain ranges. It pitched somewhat to the east (as was the case with the whole of those visited in this locality), with one exception, and appeared to be encased in solid walls some two feet apart. This company are now at work, running a tunnel to strike the lode at a depth of about eighty feet, having already made thirty feet, with, perhaps, fifty more to run. Four tons taken from the 11-foot shaft, crushed at Woodside's mill yielded eight dollars to the ton, taking no account of the gold in the sulphurets, which are said to have assayed $180 per ton.

THE COLLINS' CLAIM,

Three-quarters of a mile west, lies along the dividing ridge between Empire and Manhattan creeks, contains 1,800 feet, and was located only a few weeks since by Messrs. Collins, Hart, and others, who have gone vigorously to work, and laid bare a ledge from four to six feet wide, showing quartz containing free gold and sulphurets, equal in appearance to any in this vicinity at the same depth. They have levied no assessments thus far, sluicing out enough gold along the eastern portion of the lode to keep up expenses. My beau ideal of a claim is one that requires no assessments nor work—particularly the latter. This claim comes very near filling the bill.

After a hint or two as to the desirableness of being the happy owner of a little slice, in company with my young companion and guide, W. H. Collins, the lucky discoverer, and who had honored it with his name, crossing Manhattan Creek, I soon reached

THE ROSECRANS,

A beautiful little claim of 900 feet, lode two feet wide, the quartz in many respects similar to that of other claims herein described, particularly as regards the small, irregular, dark-colored sulphuret—a common characteristic of this section—and the usual accompaniment of gold. A cut had been made for some distance along the ledge, and a shaft sunk on the same thirty feet. From forty to fifty tons of ore, I should judge, were lying upon the dump, showing the foot-prints of time. Such ore ought not, and will not, as I now have reason to believe, remain there long.

After a hasty visit to Mr. Gruber's lode, one mile north, differing only in its apparent western dip, and a greater decomposition of the quartz, where some very rich quartz specimens had just been sluiced out, I reluctantly bade adieu to my joyous young friend, and wended my way rather wearily towards Garden Valley, two and a half miles south, to find rest for a night. Here, finding neither hotel nor boarding-house, Mr. Fox, one of the owners of the Rosecrans, found me "a stranger and took me in," and gave me a kindly welcome from the storm, for which all thanks. From this gentleman I ascertained that some ninety tons of quartz from the Rosecrans, unselected and mixed with considerable wall rock, produced upwards of ten dollars per ton, not including the gold in the sulphurets, which, from a test made in a small way, justified the belief that the full yield from the whole properly worked would have been at least thirty dollars to the ton. With the facilities for working here enjoyed, who says that it will not pay? And this claim is only one of a hundred equally promising. Getting an early start next morning, piloted by Messrs. Fox, Russell and others, several quartz lodes were soon reached, varying so little in general character from each other, that a description of one must suffice for all. We will select from among the number of Generals—

GENERAL SHERIDAN.

A shaft was down thirty feet, following a lode two or three feet in thickness, as well defined as was ever witnessed, and, at the same time, giving good evidence of permanence and value. Some thirty tons of as good looking quartz, possessing the usual favorable characteristics, as had heretofore been met with, were seen piled up for reduction at the Blue Ledge mill. The company are busy at work.

LYONSDALE AND ITS LEDGES.

This romantic little village, screened from view by the surrounding hills, covered with the California oak and pine, and thrifty undergrowth, one mile south of Garden Valley, and six from Georgetown, possesses charms both for the student of nature and the worshiper of Mammon. Here or in this vicinity are situated the Blue Ledge, the Isabel, the Generals Grant and Meade, and many others, some of which only can be even briefly noticed.

GENERALS MEADE AND GRANT,

So well known to fame, will, therefore, pardon me for a mere passing notice, being found strongly intrenched in walls of slate, on a hillside a little to the east, showing that they are composed of a better grit, of purer gold and more of it, than the world ever dreamt of; so I hasten to pay my addresses to

THE BLUE LEDGE,

A short distance from the last described, of which a brief account appeared in your issue of March 3d, stating among other things that thirty-one ounces had been recently cleaned up from sixty tons of the ore. They have plenty more of the same sort—much far better. The gold is fine—not as to quality, but as to size of particles diffused through and through the rock, in little dim yellow spots and patches, sometimes considerably lengthened, and spreading out not unlike the nebular phenomena of the heavens, as seen under a good telescope. At one point of this lode where a cut had been made on the surface, it was at least fifty feet from wall to wall, which is of hard, black slate, particularly as depth is attained; and some four veins of good ore, from one to four inches in width, the interior remaining space being filled with a species of sandstone, looking much like slate, (I am neither a practical geologist nor mineralogist, remember, and only wish to describe things as they appear to a plain prospector,) while much of it in places was almost pure quartz. I climbed down a ladder eighty-five feet to the foot of a shaft, whence a drift has been run along one vein some two feet in width for 163 feet, intersecting at that point with another shaft of some thirty feet, on the same water level. The walls, from development made at the bottom of the 85-feet shaft, are not so far apart as exhibited at the point spoken of on the surface 130 feet south, while the veinstone is gradually assuming a more quartz-like character, and the pay veins are growing apparently larger and richer, gold and and auriferous sulphurets being found in both quartz and quartzose sandstone. The company have erected a first-class, substantially-built 20-stamp mill, with battery-blocks for ten more stamps to be hereafter added, having an engine of 35-horse power, six Varney bars, and two of Hendy's Prater Concentrators, although without the late improvement as to self-discharging sulphurets, as exhibited in the cut.

The mill has stopped running until the machinery for hoisting and pumping can be placed in working order, which will probably occupy two weeks, when at least 100 tons of better rock than has yet been crushed will be put through the stamps. Those who have seen and handled the ore have no fears as to the result.

The company have two more lodes, both of which are considered promising, and one of which I saw that speaks for itself, quarter of a mile east of the mill, 1,200 feet in length, ten feet wide, rich in sulphurets, only partially developed—one shaft ten feet, but giving tangible evidence of great value, Mr. Doran, the original locator, having taken therefrom some $600 in a common hand-mortar.

The claims above, briefly alluded to as the Generals Meade and Grant, are the first two northern extensions on the lode, and have done a considerable amount of prospecting with good promise—a mill-test of 1,500 pounds on the Grant giving at the rate of $160 per ton. In close proximity to the east I saw also a very good copper lode, on which several locations had been made, and work performed, yielding sixteen per cent. ore.

CONCLUSION.

The sun, so long a stranger, is beginning to appear through the scattering clouds, reminding me that these rough sketches must have an end. I am glad of it. I grow weary of the pen, so let me now hastily and heartily return thanks to Mr. W. H. Newell, for favors and important information during my stay at the Blue Ledge Mill, as also to Mr. Wooster, my companions among the cliffs and lodes of Lyonsdale, and hurry forth to be again delighted with the varied and countless wonders of our mineral world, and the ever-growing prospects of a glorious future, of which more anon, unless you grow weary of your

PROSPECTOR.

Lyonsdale, El Dorado County, March, 1866.

[Written for the Mining and Scientific Press.]

Sodium.

MESSRS. EDITORS:—I have always called your valuable paper the miner's compass, also, his ballot-box, to decide knotty questions, and I notice that Professor Silliman, Messrs. Mosheimer, Kustel and others, have deposited their votes on sodium. For the first time mine goes in, *open*, for sodium. I have probably had more practical experience in the use of sodium for extracting the precious metals on a large scale than any other man, and I have been very much excited by its beneficial results. I appreciate and render a vote of thanks to those who first recommended me to experiment with it. As Messrs. Silliman and others have given statements of several practical workings, it is unnecessary for me to make any; I am satisfied they are correct, as they correspond with my workings, both with and without the use of sodium. Some of my experiments would appear ridiculous to mention at the present time, and I will wait until the veil is lifted. It will probably take twelve months longer to roll it high enough for us all to see clearly the facts produced by its use.

In treating auriferous ores, I have always been able to amalgamate in a porcelain vessel, by the friction or agitation of the finger, by the aid of sodium, when the ordinary mercury of commerce would not affect it.

I notice my friend, Mr. G. Kustel, has been making some experiments with sodium on argentiferous ores, with rather poor results. I hope he will not discard its use without making more experiments with different proportions. If he does, I think he will agree with me. There is no man who stands higher in my estimation as a practical metallurgist than Mr. K. In proof of this, when my scholars leave me to take charge of works, my instructions to them are, "take Kustel's work for your guide."

I do not consider a mill complete without a small furnace to make sodium. The cost of materials is mere nothing. The men who attend the amalgamators can make all they require without the loss of time. Any parties who feel desirous of making it at their mills, can receive all necessary instruction for so doing without charge, if they will take the trouble to call at my works. All who have doubts on this subject, and wish to experiment, will always find my works and laboratory free, with this exception: those who pretend to decompose and work sulphurets by the use of a few ounces of chemicals, need expect no favors there, for I consider it a bumbug; as with all of my experiments, I require a ton and a half of chemicals to a ton of sulphurets, and that will not pay on fifty dollar ore.

I would be glad to see all who have experimented with sodium march up to the PRESS and deposit their votes; but though I should choose to be with the minority, I shall still continue to use it. S. P. KIMBALL,

Proprietor of the European Metallurgical Works.

From the Stock Circular of Associated Brokers of the S. F. Stock & Exchange Board.

SAN FRANCISCO, SATURDAY MORNING, April 14, 1866.

The receipts of treasure at this port from all sources, during the quarter just ended, including coin and bullion, have been as follows:

From California and Nevada	$ 9,678,247
From British Columbia	122,345
From Northern Coast (Portland)	668,968
From Southern Coast	85,606
Imports, Foreign	435,526
Total	$11,005,692

The comparative aggregates for three years are as follows:

1864.	1865.	1866.
$12,842,206	$13,913,872	$11,005,692

The product of the mines on this coast, received through regular channels, for the above named period, was:

1864.	1865.	1866.
$10,842,306	$12,169,930	0,238,834

The figures show a decline this year as against last, of $2,931,096, and $1,603,472, as compared with 1864, owing to light receipts from Nevada during the months of January and February, and the interuption to both quartz and placer operations in this State, occasioned by the unusual severity of the winter.

FEDERAL EXPENDITURES AND REVENUE.

The expenditures of Government on this coast continue to form an interesting item in fiscal matters, and during the quarter ending March 31st, have been as follows, as compared with the same period in 1865:

For Army Department.

Quartermaster	$1,345,881
Paymaster	1,200,000
Commissary	272 076
For Navy Department.	
Navy Yard and Squadron	$ 310,000
For Revenue Department.	
Custom House services, Light House, Revenue Cutter, Marine Hospital, estimated	$ 115,000
Internal Revenue Service	55.000
Postal Service, estimated	65,000
Mint, Judiciary, Indian Agency, Land Offices, etc	90,000
Total	$3,462,957
Total, first quarter, 1865	4,118,240
Decrease this year	$ 655,283

The revenue of the Government for the same period is shown by the following figures:

From duties on Imports, Coin	$1,464,277
From Internal Taxation, San Francisco	691,569
From Internal Revenue, Interior	125,000
From Oregon and Nevada, estimated	80,000
From the sale of Stamps	75,000
From Postal Department	50,000
From Branch Mint	50,000
Total	$2,438,848
Total Revenue, first quarter, 1865	2,674,145
Decrease this year	$ 237,297

It is scarcely necessary to mention that for the above figures and estimates we are indebted mainly to the courtesy of Federal officers of this city.

The Mining Share Market has been well maintained this week, and nearly all stocks continue in request at enhanced rates.

Crown Point has met with trifling sales, receding from $1,410 to $1,390, then selling at $1,410, and closing at $1,405, bid. A dividend of $80 per foot will be disbursed to stockholders to-day, for the month of March, leaving a surplus of $48,306.08 in the treasury of the company. During the week ending last Saturday, 630 tons of ore were extracted from the mine. The south drift, (main lode, third level,) 266 feet from the north line, is said to show a decided improvement. The incline from that level is down some thirty feet, and is looking well; 3,247 tons of ore were crushed last month, averaging $46.76 per ton.

Savage has been in rather better favor, advancing from $1,060 to $1,100, and declining to $1,085. Some ore is being extracted from the sixth level, and a steady increase in the productiveness of the mine is now looked for. Gould & Curry is dull and inactive at about $980 asked.

Hale and Norcross declined from $960, buyer 20, to $930, advanced to $1,000, buyer 10, receded to $975, and was held yesterday at $980. A dividend of $50 per foot will be paid to-day. There is no material change in any portion of the 700 feet level, save that the fifth floor is said to disclose a better quality of ore than has been met with recently.

Yellow Jacket was not so well sustained, and some 100 feet were sold, advancing from $865 to $950, dropping to $925, and selling at the close at $840@852½. The balance sheet of the Company, April 1st, shows a surplus on hand at that date, after the payment of all liabilities, of $11,238.66. During the month of March their receipts of bullion amounted to $96,519.65, from 2,747 tons of ore crushed at the Morgan mill, and 1,871 tons reduced by outside mills; from assessments $180,000 was obtained, and other sources of revenue produced $10,990.69, in all $287,510.34. On the first of March last, the Company's indebtedness was $175,938.87, and their current and extraordinary expenses during that month amounted to $100,333.81, making a total of $276,272.15, as against the above receipts. The first crushing of twenty three tons of ore from the south mine, produced $7,029.31—$32.85 per ton.

Ophir rose from $745 to $800, buyer 30, receded to $765, rallied to $780, and sold yesterday at $800@850. Latest telegraph advices represent the "body of ore in the ninth gallery well defined," and the upper floor looking particularly well. From ths 3d to 10th inst., inclusive, some 350 tons first class and second class ore was taken from this portion of the mine, worth, it is thought, an average of at least $90 per ton; and during the same period about 200 tons of first and second class ore were extracted from the fourth and seventh galleries. Receipts of bullion since the 1st inst., have amounted to $33,888 33.

Chollar-Potosi is in rather less favor, and some 250 feet were dealt in, declining from $390 to $365, and selling yesterday at $366@365. The gross yield of 3,800 tons ore, nearly all of which was sent to custom mills last month, was $85,950; and the net receipts were $37,240.82 less the cost of mining. $13,381.99, disbursements for the new shaft, $9,254.15, and other expenses amounting to $2,613.99. These figures show a clear excess of receipts over all expenditures for the month of March, of $13,957 57. The Company are out of debt, with a surplus at their credit. During the week ending April 5th, 769 tons of ore were sent to custom mills, and 71¾ tons were sold at $8 per ton. In the Bajazette ground the winze from lower stope shows a body of ore three feet wide. In the stope overhead of incline, the vein of ore is narrow, but of good quality. The Grass Valley Station is looking very well, and some ore taken from the Belvidere shaft, at a depth of 150 feet, assays $30@100 per ton.

Alpha rose from $440 to $460, and is now held at $455. Belcher has continued active, advancing from $355 to $390, buyer 30, receding to $355, and closing at $360. Empire Mill was dealt in at $200 per share, and closes at $205, asked.

Imperial has been in better request, and some 750 shares were dealt in, advancing from $138 to $150, receding to $144, rallying to $155, and selling yesterday at $146@148. The Imperial-Empire shaft is down some 290 feet, and the drift from the old shaft is in about about ninety-five feet toward the new or seventh level. The first crushing of the Crown Point Mill, this month, shows a better yield, and amounted to $12,400.

Overman rose from $72 to $82, fell to $76, and closes at about $75. Bullion has been dealt in within a range of $112@120, closing at $113. Confidence rose from $35 to $39, and sold yesterday at $37.

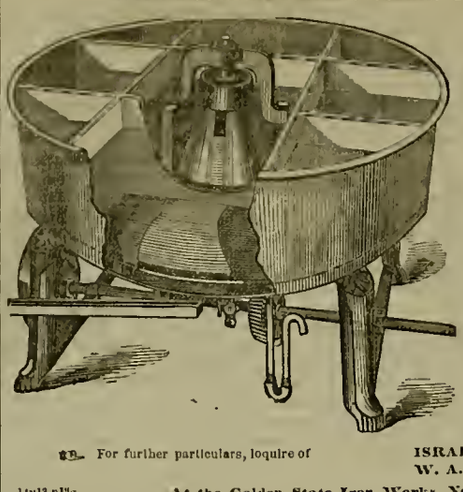
Knox's Improved Patent Amalgamator and Separator,

With Palmer's Patent Steam Chamber or Die.



THIS CUT REPRESENTS AN AMALgamator and Separator that has stood the test of FOUR YEARS' practical working in the gold mines of California, and for nearly the same time in the silver mines of Nevada, having been introduced into the first steam mills built in the then Territory, since which time they have been successfully working against all competition.

The great advantages these Amalgamators have over any others, are—

1st. **Much less Cost.**

2d. They do not "flour" the mercury, and collect any that may have been "sickened" in the battery or grinders.

3d. The "shaking" motion given to the pulp (by the revolution of the muller under the stationary frame) against the amalgamated copper plates that are fastened to the frame, and by this means catching the fine gold and mercury that will not settle.

4th. The gate in the cone, through which the pulp is discharged, from the top, and where there is the least motion, almost precluding the possibility of any granulated mercury or fine gold escaping.

There are over **500** of them in use in California and Nevada, where these interested can see their practical workings.

☞ For further particulars, loquire of

ISRAEL W. KNOX, OR
W. A. PALMER, Inventors,

14v13-p12-1 **At the Golden State Iron Works, No. 19 First street, San Francisco.**

ANNUAL REPORT
—OF THE—
Pacific Insurance Company.

IN COMPLIANCE WITH THE ACT OF THE LEGISLature of the State of California, entitled "An Act concerning Corporations," passed April 24, 1850, the Pacific Insurance Company of San Francisco makes the following Annual Report:

I.—The amount of the Capital Stock of this Company is SEVEN HUNDRED AND FIFTY THOUSAND DOLLARS, and paid in GOLD.....$750,000

II.—The amount of the Assets is ONE MILLION AND FIFTY-ONE THOUSAND, FOUR HUNDRED AND TWENTY DOLLARS AND THIRTY-SEVEN CENTS..$1,051,420.37

III.—The Company has NO DEBTS

IV.—The amount of insurance effected during the year, and which remained in force December 31, 1865:

Fire.....$12,073,949
Marine..... 481,408

This Company commenced underwriting Marine Risks, August 1, 1865.

V.—This Company insures against the following risks, viz.: BUILDINGS, HOUSEHOLD FURNITURE, MERCHANDISE, RENTS, LEASEHOLDS, VESSELS IN PORT AND THEIR CARGOES, and other PERSONAL PROPERTY, AGAINST LOSS OR DAMAGE BY FIRE.

Also, on CARGOES, TREASURE, COMMISSIONS, PROFITS, and WAR RISKS, and ON ALL MARINE AND INLAND NAVIGATION RISKS, TO AND FROM ALL PORTS IN THE WORLD.

VI.—This Company will take on any FIRST-CLASS RISK not to exceed $75,000 (the limit fixed by law), and on all large risks will reinsure to an extent consistent with PRUDENCE in other RESPONSIBLE COMPANIES.

J. HUNT, President.
A. J. RALSTON, Secretary.

QUARTZ OPERATOR'S
HAND BOOK

A Book for Every Intelligent Prospector, Shareholder, Miner and Machinist.

ZENAS WHEELER AND P. M. RANDALL,
Authors and Publishers.

BOUND IN CLOTH—144 PAGES, DUODECIMO.

THE QUARTZ OPERATOR'S HAND BOOK is presented to the public as a carefully prepared epitome of all that is valuable for the practical operator in the mine and mill. We have here all the most necessary hints and directions for testing and assaying the ores of the various minerals; an explanation of chemical terms; a brief and intelligible description of the numerous processes for roasting ores, and the extraction of metals from their ores by amalgamation and otherwise.

The work also contains an original and highly interesting discussion of the tractory and differently formed grinding plates, as applied to the reduction of ores—a subject not only of special interest to the scientific reader, but also practically of the highest importance to every quartz miner.

Professor Silliman, of Yale, and Hodgson, of the College of California, having examined this discussion, as submitted to them by its author, Mr. Randall, previous to the compilation of this work, speak of the same as not only mathematically correct, but also as of great practical value. Messrs W. R. Eckart, Jr., Engineer, (late of U. S. N.,) and W. M. Belshaw, assayer and superintendent of the S. T. M. Co., to whom the entire work was submitted while passing through the press, speak of the same as one of high practical importance to quartz miners and millmen generally.

No work has been offered to the mining public of California which contains so much valuable information, condensed into so convenient a space as is here presented. In its preparation, much care has been taken to secure brevity, conciseness, and simplicity—in fact to make it a complete and reliable QUARTZ MINER'S HAND BOOK.

The Table of Contents of this book will be found on pa 415 of the MINING AND SCIENTIFIC PRESS of July 1st, 1865.

Sold by booksellers generally. Price by mail, postage paid, $1.25. Address "Wheeler & Randall, at the Mining and Scientific Press Office, San Francisco." 2v11

Our Circulation.—THE MINING AND SCIENTIFIC PRESS has a large and permanent subscription list, and enjoys a more universal circulation among stockholders and persons directly interested in mining than any other paper on this coast.

New Mining Advertisements.

Continued Mining Advertisements will be found under another head

Assurance Mining Company.—Location: Occidental Lode, San Benito Mining District, County of Monterey, State of California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 10th day of April, 1866, an assessment of twenty-five cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the company, 302 Montgomery street, Room No. 4, San Francisco.

Any stock upon which said assessment shall remain unpaid on the 11th day of May, 1866, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the 29th day of May, 1866, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

WM. F. BRANDRETH, Secretary.

Office, 302 Montgomery street, Room No. 4, San Francisco, California. ap14

Beard & Seaver Gold and Silver Mining Company, Lander County, Nevada.

NOTICE.—There are delinquent upon the following described stock, on account of assessment levied on the 14th day of March, 1866, the several amounts set opposite the names of the respective shareholders, as follows:

And in accordance with law and an order of the Board of Trustees, made on the 14th day of March, 1866, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of the Company, on the 1st day of May, 1866, at the hour of 2 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

N. C FASSETT, Secretary.

Office, 402 Front street, San Francisco. ap14

George Washington Gold and Silver Mining Company, Silver Mountain District, Alpine County Cal.—Assessment No. 11.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 10th day of April, 1866, an assessment of one dollar per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, at the Office of the Company only.

Any stock upon which said assessment shall remain unpaid on the 12th day of May, 1866, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the 29th day of May, 1866, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees

W. D. ROOT, Secretary.

Office, 338 Montgomery street, San Francisco. ap14

I. X. L. Gold and Silver Mining Company, Silver Mountain District, Alpine County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 5th day of April, 1866, an assessment of one and a half dollars per share was levied upon the capital stock of said Company, payable immediately in gold coin of the United States of America, to the Secretary, at the office of the Company, No. 338 Montgomery street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the 17th day of May, 1866, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on the 7th day June, 1866, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

JAMES C. DAYLEY, Secretary,
ap14 No 338 Montgomery street, San Francisco.

Mining Summary.

CALIFORNIA.

The Downieville *Messenger* says the prospects of an extraordinary yield of gold throughout the northern mines are more apparent daily, and reports are coming in from all sections of this county of progress made that will insure these results. The activity manifested in mining of all kinds exceeds anything we have seen for several years, while the present developments promise more largely than usual for the future.

The want for steady day labor are rapidly increasing, and there is not that feeling of compulsion to move that has heretofore been felt among the floating and foot-loose population. True, there are some going after distant mines, but a majority are satisfied to chance it where more sure returns await them. There will be many going to Summit City, which we consider offers better inducements than any distant location, though it is doubtful if those who go will average to do as well as those who remain, excepting, perhaps, the most fortunate ones, among whom we would class those traders who go to do a safe and legitimate business on cash principles.

PLACER COUNTY.—The Sacramento *Bee* of April 5th, says that the mining items in Placer county, which have been under a cloud for some years, are looking up. A private letter from Forest Hill says there is a great excitemsnt there at present, by the discovsry of the great wealth of a large number of old gravel and cement claims, which had been worked for years by the hydraulic and sluice processes, and which were considered worked out, and some of them abandoned as worthless. Recent developments, by the aid of crushing and amalgamating, have demonstrated that the bulk of their mineral resources had really never been touched. In years gone by, Forest Hill was one of the best mining localities in the State, and the old times are reviving.

A correspondent of the Placer *Herald* says that the last rains were of much help to the placer mines in that county.

The miners in the vicinity of New Castle are, very generally, turning their attention to quartz, and some good strikes have been made. The leading claims there are the Pacific and Ad Valorum silver leads, and the Kearsage gold lead. The former company has changed ownership and the new company has gone to work in earnest to develop the mins. Mr. Wm. Penrose, agent of Vivian & Sons, the extensive copper smelters of Swansea, visited this mine a short time since, and pronounced it valuable ore, and stated to the company that he was prepared to buy this ore, at a fair price for shipment. This endorsement of the value of a silver mine in that section will accomplish much in doing away with the idea that it is useless to look for silver in California.

The *Stars and Stripes* of April 4th, says that the Rough Gold company, at Bath, cleaned up last week, from one week's run, 173 ounces of gold. The previous week they cleaned up over 160 ounces. Other companies in the vicinity are doing well, but we have no figures from them.

CALAVERAS COUNTY.—The Copperopolis *Courier* says that never since the discovery of copper in that district, have the mines looked so promising as at present. The Union and Keystone, which head the list, are being placed in condition for extensive operations, and will yield immense quantities of ore the coming summer. The latter mine, under the efficient management of Mr. Sheldon, is about to become dividend property. It is difficult to estimate the value of this mine. From one end to the other, a distance of half a mile, the croppings can be traced without difficulty. Good copper has been found in all the shafts, and everything goes to show the inexhaustibility of the mine. In one year hence the Keystone, it is believed, will take its place among the great paying mines of the world. The Empire, though unprofitable at present, presents unmistakable indications of permanency. The Calaveras has been idle for a long time, notwithstanding the fact that when worked it yielded largely of first class ore. This mine, it is believed, is only surpassed in value by the Union and Keystone. Then we have the Table Mountain, the Caledonia, the Kentucky, the Scorpion, and a score of other and equally valuable mines, the value and extent of whose metalliferous deposits are being satisfactorily tested. A glorious future of prosperity and wealth awaits the owners of our mines. Their energy and perseverance will surely be rewarded.

SHASTA COUNTY.—The Shasta *Courier* says that the season for extensive mining operations leads us to look around a little and see how Shasta miners are going to improve it. Upon inquiry, we find that a company at Middletown are going to erect a flume some half mile in length, to carry water from the Clear Creek ditch to some mining ground, lying along the southern side of Oregon Gulch. This flume will not only furnish the company's claim, which is rich and extensive, but will be of sufficient capacity to afford water for hundreds, who can and will occupy ground below it.

Another company will open a hydraulic claim on the west bank of the Sacramento, about four miles below town, with flattering prospects. These two enterprises begin with prospects as flattering as any we read of, and the quantity of ground thus opened for work is very extensive— sufficient for a thousand or fifteen hundred miners.

The Horse Shoe Bend will be open for work as soon as the waters subside to the capacity of the tunnel, and a river bed of over three miles will be laid bare to the operations of the hardy miner. Persons desiring claims on this ground should soon be making arrangements, for there will be a rush as soon as dry diggings cease to be available.

The Washington Quartz Company cleaned up the last day of March, after running twenty-four days with nine stamps. The result was the snug sum of $5,371.31. For this run the company divided $4,290 to twelve shares—$357.50 to the share. The rock crushed averaged $20 per ton. The company now have their lode stripped one hundred and fifty feet—from top to lowest tunnel—by four hundred feet on the face. There is another tunnel in over four hundred feet, and about forty feet short of the ledge, that will strike it some two hundred feet lower. The editor of the *Courier* is assured that the company can easily select rock from which a run of $15,000 or $20,000 could be had in a few days' crushing, if it was at all desirable to get up a sensation.

ALPINE COUNTY.—We learn from the Monitor *Gazette* that 1,500 pounds of the ore from the Morning Star has recently been tested at the Yellow Jacket Mill, at Empire. The returns give a result of over $85 to the ton, while it is found very easy to work. Any amount of such ore as that worked can be readily obtained. The Superintendent of this mine, Mr. J. C. Ranson, recently visited the Swansea Smelting Furnace, lately erected in Washoe Valley, and from what he learned there is of the opinion that the Star ore can be most profitably worked by smelting. The proprietors of this furnace are positive in their assurances of success with it, and offer to bear the expense of transportation of three tons of the mixed ore and give it a fair trial. The amount will be sent next week. If this proves a success it will enable the company with much less expense to place this mine in a condition to declare dividends.

Mr. E. Arnold, Superintendent of the Monitor Company, has struck the vein within thirty feet in a tunnel run in from near the bed of the Creek in Lexington Canyon. The lode is eighteen inches wide of pay-ore, which he is now taking out and will haul to the mill for a test of its value.

The Winchester Company are now running in on one of their ledges, taking out ore to be sent to the Pioneer Mill. This company have three ledges now open in the course of their tunnel, all containing gold and silver; whether in paying quantities is to be determined without delay.

A vein of ore has been struck in the American from which some of the finest specimens ever seen outside the Morning Star, which, says the Monitor *Gazette*, in some respects it resembles, have been taken; all coincide in the opinion that it is identically the same ledge.

In Silver Mountain district, work is progressing in good earnest. The Rippon Company are hard at work. The rock looks and assays well, and earnest efforts are being made to give it a thorough mill test.

The George Washington Company will be proved within the next sixty days. The Pennsylvania Company have a large ledge of $15 rock in their upper tunnel, and are now running one lower down. Carmichael and Drake are working away on the Mary Francis, confident of success. The old Scandanavian near the mouth of the canyon of the same name, is quietly moving. The Buchanan No. 2, already proved to be one of the richest mines in Alpine, with 50 or 60 tons of pay ore on the dump and any quantity in sight, has been under what we must call a very mistaken policy, sent east to be sold, and must remain idle for sometime. The Lady Franklin Company, owning a claim on the same lode as the Buckeye No. 2, will soon resume operations, under auspices bright and encouraging. The Balaklava Company are meeting with every encouragement in running on their ledge. Altogether, this district is looking prosperously and may congratulate itself on being nearly out of the wilderness.

NEVADA COUNTY.—We learn from the *Union* of April 3d, that a crushing of fifty tons of rock from the New York Hill mine, yielded the snug sum of four thousand dollars, or about eigbty dollars to the ton. This is one of the most promising mines in this vicinity, and when the company have completed the erection of the necessary apparatus for working the mine, we feel assured it will exceed the most sanguine expectations of its fortunate owners. Messrs. Dibble, Byrne & Sykes, of Grass Valley, are, we belisve, the largest owners in the New York Hill claims, Mr. Byrne occupying the position of secretary of the company.

The same paper says that a half ounce vial of dirt from the now celebrated Stockton mine, located two miles below the Forest Spring House, and about six miles from Grass Valley, yielded, after being washed out, six dollars in gold. The gold is very fine and of good quality.

The Eureka mine, under the able management of the Messrs. Watt, still keeps up its reputation as one of the best paying claims in California. The average weekly yield of the mine is between twelve and sixteen hundred ounces of amalgam, which yields about nine dollars per ounce of fine gold. There is a fine furnace attached to the mine, and the proceeds of the mine are melted into bars semi-monthly and forwarded to San Francisco for coinage.

TUOLUMNE COUNTY.—A company on Pacific Flat, near Algerine, says the *Courier*, came across a quartz lead which shows much gold. The lucky fellows have already taken out several thousand dollars, much more of the stuff being in sight. Last Saturday, a Mexican prospecting on Whisky Hill, below Jamestown, struck a pocket, and in a few hours took out a panful of very rich specimens. On Wednesday, a miner on Wood's creek picked up a chispa worth twelve dollars. These things speak well of Tuolumne.

Josephi's new mill, on Bald Mountain, commenced running a few days since. It is of the capacity of five stamps, run by a hurdy-gurdy wheel, and the whole apparatus is pronounced first-class by those competent to judge. The company have a large amount of quartz out, which will, from appearances, yield fairly.

The Sonora *Herald* says the Comstock & Fry Co., have purchased the ten stamp mill known very generally to quartz miners as the old "Wheeler & Thayer" mill, and which was erected and used by its proprietors for custom work, but which will be used hereafter in connection with the aforesaid lead. Started up last week.

The famous Rawhide Mining Company have nearly completed their new twenty stamp mill, which will be, without exception, the finest quartz mill in the Southern mines. The work is being pushed forward with great energy, and the probabilities now are that within sixty days the neighborhood will be startled by the thunderings of its twenty titian trip hammers.

C. T. Meader & Co., are now sinking a shaft for the Chaparral Company, with the privilege of purchasing the mine at a price agreed upon, if the prospects are favorable at a certain depth. Some days back, one thousand pounds of rock, taken from the shaft now being sunk, were taken to Dr. Walker's new mill, just outside of Sonora, and there crushed, the result being forty dollars—at the rate of eighty dollars per ton.

The Golden Rule Mining Company have a very fine lead, from six to eight feet wide. They have been running only five stamps, but have taken out some weeks as high as three thousand dollars. They have now completed a new fifteen stamp mill, with all the modern improvements, to run in conjunction with the old one. The new mill commenced running this week.

The Buchanan Company have also been running but five stamps, but have recently added five more. They started on the 18th. The rock has averaged, so far, about forty dollars per ton.

The Sonora Gold Company are about to erect a fifteen stamp mill, with all the latest improvements, on the old Sell & Martin lead. We understand that this is a New York Company, and their agents are now in this city preparing to commence work as soon as the material can be placed upon the ground.

WASHOE, NEVADA.

A gentleman furnishes the editor of the Lyon County *Sentinel* with the following information concerning the Nevada Smelting Works, at Nevada:

A furnace has been built at Washoe, about one mile from Mill Station, which promises to create a revolution in processes hitherto used for reducing rich ores. The builders and proprietors, Messrs. Edwards, Williams and Richards, all professional smelters from Swansea, have been for the last six months engaged in experimenting upon the fusible properties of our ores. After many failures, arising from difficulty in obtaining suitable materials, and after many experiments, in making of which neither pains nor expense were spared, their efforts have been crowned with success and their most sanguine expectations realized.

They are enabled by their process to reduce three and a half tons of ore in twenty-four hours to within eight per cent. of the result obtained by fire assay. The furnace is built upon the improved reverbatory principle, and is more especially adapted for the smelting of argentiferous galena. The success attending their treatment of Comstock and Truckee ores, as shown last week, is sufficient to convince the most incredulous that their furnace is a decidedly big thing, and has supplied a want long felt in Nevada by those interested in mining. Success to the Nevada Smelting Works.

An array of the ingots of lead produced at this furnace, made by Messrs. Edwards & Wiegand, of Virginia City, showed it to be worth $227.49 per ton in silver.

WALKER RIVER MINES.—The Esmeralda *Union* has been informed that a New York company have purchased an interest in the Walker River mines, and are driving business along in a highly creditable manner; also, that the mines are looking well and they are to have a mill erected immediately, which will test the matter more thoroughly.

The *Enterprise*, of April 6th, says:

The trouble with water in the Ophir is very trifling—nothing near so bad as we were led to believe and were induced to state in our item a day or two since. The truth is that no very great difficulty has been experienced in mining upon the lower level. One set of timbers was displaced by a slide in the vein; otherwise all is right.

The *Union* of the 6th inst., speaking of the rich strike in the Yellow Jacket mine, says it was made on Saturday last in their south shaft, down some five hundred feet. So far, the rock taken out will "mill-work" upward of $900 per ton. The quartz shows the same kind of sulphurets as the Kentuck and Crown Point. In this strike of the Yellow Jacket mine is one of the many evidences which of late are showing that our mines on the great Comstock lode are truly on the "come out" with their rich bullion.

Everything is progressing finely at the new Savage Hoisting Works. A large portion of the machinery is in place, and one engine is already is use hoisting from the shaft which is now down 430 feet, and steadily being driven downward. When this shaft is down to a proper depth, it will give the company great command over all the upper portions of the vein. The works being wholly on sound ground, there will be no trouble with the machinery from the settling of the earth under the foundations of the engines.

Another new mining region is reported at the head of the American river, in the same range of country, we presume, as Summit City, only further north. The diggings are reported to be "marvelously rich," and supposed to be the spot where a party of Frenchmen took out some $100,000 each in 1862.

Still another new mining district has been discovered in the White mountain, about fifty miles southeast of the Silver Peak District. Sixteen lodes have been located, ranging in thickness, at the cropping, from three to twelve feet. The district has been named "White Mountain. Some of the veins exhibit gold without a trace of silver; others contain both gold and silver.

REESE RIVER, NEVADA.

The *Reveille* says that the Assessor's books give the returns of a crushing of thirteen tons of ore recently obtained from a claim on Lander Hill, at $10,691—an average of over $800 per ton. The mine is known as the Blind Ledge, owned in whole or in part by Walker and Fuller, and situated on Lander Hill, a short distance below the Oleander, was worked by J. W. Varney, at the Ware mill, and yielded the splendid amount above named.

Interesting reports are coming in from the Twin River country. Scarcely a day passes, says the *Reveille*, in the course of which there is not occasion to mention some handsome development in some one of the numerous locations in that region. The ores that are assayed from that region, generally yield from $150 to $300 per ton in silver with a very little gold. They are mixtures of chlorine and sulphurets; the latter, of course, will predominate in depth.

A supposed extension of the well known Murphy ground, two miles south of the original, is now being developed with good success. The ore assays over $300 to the ton—picked rock we presume. The ledge is said to be very large, fully twenty feet thick cropping out of the ground. The ore assayed was taken from a point twelve feet above the surface.

Two other claims, known as the Green Mountain and Fairmount have recently been

located in this district; the former by T. Warburtao, and the latter by Messrs. Barnes & Davis. Surface tests from both claims are very encouraging. They have been sold to Eastern capitalists.

The Twin River district is located on the eastern side af the Toiyabe mountains, Nye county, twenty miles east of lone city, nnd fifty miles southeast of Austin. The richness and permanency of the mines of this district appear to be very generally coneeded by all who have visited them.

The Reese River region is destined to become quite as celebrated as the more accessible but not richer Washoe section on the western borders of Nevada. A late number of the *Territorial Enterprise* informs us that the Lea mine, San Antonio district, will yield $3,000 to the ton. This lead is nine feet wide and all pay rock. Tha mine is owned and worked by Messrs. W. H. L. Barnes and Geo. Hunt. During the past year they have erected a large mill and reduction works near the mine, und the latest accounts confirm the extraordinary statements given above. The San Antonio district has been long considered one af the richest in Nevada, and this practical demonstration of its wealth ranks it amongst the most valuable on this coast.

The editor of tho *Reriellе* thinks this is "important if true;" but fears it may bo jast a trifle exaggerated.

Mining Statistics.

A paper was recently read by Dr. R. P. Stevens before tho Polytechnic Institute, N. Y. upon the mining interests of tbe United States, which coatained tho following valuable statistics:

By the National Census Statistics of 1860, the mining products of the country, including those economies closely allied to it, as quarrying of marble, diggiag clays, etc., the annual aggregate amouat is $106,894,460, and the manufacturing intcrests growing immediately out of mining, amounted in the year to $505,398,000, while the whole manufactuto of the country amounted to $1,895 861,000. The mining interests is tbus already one-third of the whole.

An cxamination of the mioing statistics in detail affords some very important and interesting facts. Iron, for instance, in the rough ore, just brought to the surlace, is the ore of least value per ton, but when maaufactnred, the $7,723,000 of raw material iacrease to $132,724,000, wbile gold, which is the most valuable of ull metals, immediately upon raising in its increased value in manufactures, is least a all in proportion to the amount raised. Of $47,566,000, only $19,835,000 enter into the mnnufactures of the country. Lead and copper both yet exceed this metul in aggregate value.

The economies of coal afford another very interesting field of exploration. The amouat of this fuel raised to the surface was $20,343,000, of which $8.369,000 was bituminous. Ol this tho value of $4,000,000 was manufactured into gas, with an increased valne of $12,030,000. Tbe consumption of gas leads to the aecessity of gas-fixtures of various kiads, and these amount to $2,695,500, confiaed to the States of Massachusetts, New Jersey, New York, Ohio, Pennsylvania, Rhode Island, Illiaois.

The amount of coal consumed in the various kinds of steam engines, ia producing mechanical force, thus adding to the power of man, and cheapening his labor, is equivaleat to addiag to tbe laboring force of the country a population of twenty-eight millions of mea, working eight hours a day. It gives employment to thirty thousand workmen, womeu and children in this city, who aaaually earn to tbeir employers $50,000.

Pennsylvaaia takes the lead in miaing coal, Ohio follows, and thea succeeds Illinois. Ia 1850, this latter State had but two or three well establisbed collieries, and must have ranked at that time the sixth ia the amount raised.

Rich Sulphurets in Placer County.—The Placer *Herald* says tbat experiments have recently been made by Messrs. Choate and Pugh, of Ophir, which developed the fact that the sulphurets in the quartz of that region are rich in gold. Ia an experiment made by Mr. Pugh upon sulphurets taken from the Sonora ledge, the yicld was at the rate of $1,800 per ton. Mr. Choate got from the sulphurets of the San Francisco company at the rate of $2,240 to the ton.

Mr. Pugh is now erecting a coaceatrator ia his mill to save sulphurets—when this is done large yields may be expected from quartz crushed at his mill.

Tbese facts are cbeeriag indeed. For it is well kuown tbat the quartz veins aroaad Ophir aad Auburn are well filled with sulphurets, as well as free gold.

(Written for the Mining and Scientific Press.)

Mining in Mount Diablo.

Editors Press:—During the past four months I have repeatedly visited the mines situatad in this delectable mountain, and, in a mining point of view, I am very much pleased with my sojourn in this mast interesting locality, as it afforded ma an opportunity of ascertaining the bearings, etc., of the different stratas in which are found veins of copper, cinnabar and coal. Of this latter mineral the supply appears inexhaustible.

The Cumberland coal mino shows a healthy aspect, and the rnising of 200 tons per day will soon be made available, the increaso of which entirely depends upon the management of the mine, and a more expeditious modo of transportation. In passing along to the Peacock mine we find a great deal of work done, but to little purpose. The merits af this property will place it in juxtaposition with the far-famed Black Diamond. Practical development will verify the assertion. We now notice the San Francisco coal mine, which I believe is under the able maaagement of B. Joaes, Esq. Here things are kept agoing as regular as clockwark, and receat developments augur well for the futare of this invaluable property. I use the word *invaluable*, because nothing equal to it has as yet been discovered ia the coal range of Mount Dinblo.

The newly-sslected place for the base of futare operations was judiciously planned, and resulted in a valuable discovery of coal tweaty four feet below tho surface. The vein is three feet wide, of which two fect produce remarkable coal of rather superior quality at such a shallow depth. Should this mine be vigorously worked, tho preseut year will put the proprietors ia a position to raise 150 toas per day, with ample reserves when needed.

Underaeath this splendid veia of coal *is found a bed of fire-clay*, of superior quality, the genuineness of which has been proved beyond a doubt. A plan of operations is on the tapis for making fire-brick, which I have no doubt will be commenced immediately, and my conclusion is, that the result will be the production of an article aever as yet equaled ia Califoraia.

THE COPPER MINES.

The prospects of the copper mines are truly encouraging, and their merits call for energetic development. I believe the Wihooken, as a copper mine, bears the palm of a *bona fide* speculation; a sample of the ore assayed at San Francisco gave a produce of 23 per cent. of copper. This encouraged the shareholders to prosecute the work vigorously, so they at onco commaenced a drift on the course of the lode leading towards the bunch of ore gone down in the bottom of a shallow level. Should they strike it so rich in the present drifts, the merits of Mount Diablo will be fully estab lished as a copper-bearing district, and the fortunate shareholders will be amply rewarded for their labor.

The Nucleus is another very promising mine, and one likely to turn out a good thing. The recent discovery is a very important one, and should stimulate those interested to more vigorous operations. There are other mines equally as promising as those already named, aad I have no doubt, if worked with enterprising spirit and practicable management, many of them would prove valuable. Thousands, aay, tens of thousands, of tons of ore can be taken out of Mount Diablo, which will give an average yield of from four to eight per cent. of copper, and with some cheap mode of dressing it, could be brought to ten or even fifteen per cent. Hence, it is obvious that the erection of furnaces would be the salvation of the mines! Without this is done, I fear the copper mining interests will be slow and tedious; but should a company be formed, and furnaces erected, I am confident that hundreds of hands would be employed—the miners would do well, and the smelters would do better, and that many a hundred tons of copper would be returned per annum from Mount Diablo.

Superintendent.

Coal in Oregon.—The Oregon State *Journal* states that Waud & Moore are opening a coal bank about two miles south of Eugene City, which gives good evidence of being valuable. At the depth of sixty feet, it is of a quality much improved over that at the beginning of the tunnel. It is yet somewhat mixed with slate, but burns well. Waud discovered the croppings two years ago.

Lake Superior Copper.—The total copper product of Lake Superior ia 1864 was 8,561,999 tons, producing about 6,850 tons ingot copper, wortb $6,859,000.

The Origin of Things.

Days of the Week.—In the Museum of Berlin, remarks a writer in a Newark paper, in the hall devoted to Northern antiquities, they have the representations of the idols from whom the names of the days of the week are derived. From *Sun* comes *Sunday*. This idol is represented with his face like the sun, holding a burning wheel, with both hands on his breast, signifying his course around the world. The idol of the *Moon*, from which cometh *Monday*, is habited in a short chuk, like a man, but holding the moon in his hands. *Tuisco*, from which cometh *Tuesday*, was ane of the most ancient and peculiar gods of the Germans, and is represented in his garment of skin, according to their peculiar manner of clothing. The third day of the week was dedicated to his worship. *Woden*, from whence *Wednesday*, was a valiant prince among the Saxons. His image was prayed to for victory. *Thor*, from whence *Thursday*, is sented on a bed with twelve stars over head, holding a sceptre in the right hand. *Frygo*, from whom we have *Friday*, is represented with a drawn sword in his right hand, and a bow in his left. He was the giver of peace and plenty. *Seater*, from whom is *Saturday*, has the appearance of perfect wretchedness; he is thin visaged, long haired, with a long beard. He carries a pail of water in his rigbt hand, wherein are fruits aad flowers.

First Use of Papea Money in America.—The first American colonists used pelting and wampum substitutes for coin. In 1640, the Couneil in New Netherlands petitioned to raise tho value of money in their colony, in order to prevent its exportation. Afterward, Governor Stuyvesaat tried to introduce a specia currency, and to establish a mint at New Amsterdam. New England already had her mint. Massachusetts was the first of the colonies to uso paper money. In 1690 it issued bills to the amount of seven thousand pounds to pay the soldiers engaged in the expedition against the French in Canada. Twelve years after, Carolina issued paper money to pay her soldiers. Three or four years after, a paper money Act was passed in the island of Barbadoes. A little after, ia 1703, Coanecticut and New York passed enactments creating bills of credit. The low state of the currency at this time in New York was thought to arise from the fact that most of the forcign trade of the country came through Boston and other New England ports, drawing thither money and produce. In 1695 the difference between New York and sterling money was about one-fifth; in 1700, about the quarter. The present legal rate of interest in New York (seven per cent.) was established in 1738.

A Beautiful Illustration.—At oae of the anniversaries of a Sabbath School in London, two little girls presented themselves to receive the prizes, one of whom had recited one more verse than the other, both having learned several thousand verses of Scripture. The gentleman who presided inquired, "And could you not have learned one verse more, and thus have kept up with Martha?"

"Yes, sir," the blushing child replied; "but I love Martha, and *kept back on purpose*"

"And was there any of all the verses you have learned that taught you this lesson?" again inquired tbe President.

"There was, sir," she answered, blushing still more deeply: "*In honor preferring one another.*"

What is Saleratus?—Wood is burnt to ashes, wie laxivated, aad ley is the result. Ley is evaporated by boiling, black salts is the residum. The salt undergoes purification by fire, and the potash of commerce is obtained. By another process we chauge potash into pearl ash. Now put these in sacks and place them over a distillery wash tub, where the fermentation evolves carboaic acid gas, and the pearlash absorbs it and is rendered solid; the product being heavier, whiter and drier thaa the pearlash. It is now saleratus. How much salts of ley and carbonic acid gas one can bear and remain healthy, is a question for a saleratus eater. Some people say saleratus will act harm the stomach. It is a *ley*.

Sleeping With the Head to the North.—Herr Dr Julius Von Fiechweiler, an eccentric Germaa physician, recently died, leaving in his will what he considered a secret for increasing the years of our life. His own age was 109, and he attributed it to the fact that he always slept with his head to the north, and the rest of his body, as nearly as possible, in a meridianal position. By this means, he thonght the iron in his body became magnetized, and thus increased the energy of the vital principle.

Life is like a field of blackherry aad raspberry bushes. Mean people squat dowa and pick tbe fruit, ao matter how tbey black their fingers; while genius, proud aad unbeading, strides fiercely on, and gets aothing but scratches, and boles toru io his garments.

MINING AND SCIENTIFIC PRESS

PATENT AGENCY.

For the Pacific Coast.

Office of the Mining and Scientific Press—No. 505 Clay street, corner of Sansome, San Francisco.

Information for Inventors!

Inventors on this coast having their applications for patents made out through our Agency can sign their papers at once, and thus secure their rights at least three months sooner than by trusting the same to distant agencies, situated in New York or Washington.

The first question that presents itself to the Inventor, who desires to procure a patent, is: "Can I obtain a patent?" A positive answer to this question is only to be had by presenting a formal application for a patent to the Government, embracing a petition, specification, model, duplicate, drawings, and the payment of the prescribed official fees. Aside from these steps, all the inventor can do is, to submit his plans to persons experienced in the business of obtaining patents, and solicit their opinion and advice. If the parties consulted are honorable men, the inventor may safely concede his ideas to them, and they will inform him whether or not his invention is probably patentable.

Those who have made inventions and desire to consult with us respecting the same, are cordially invited to do so. We shall be happy to see them in person at our office, or to advise them by mail, or through the Mining and Scientific Press. In all cases they may expect from us an honest opinion. For these consultations, opinion and advice, we make no charge. A pen-and-ink sketch, and description of the invention should be sent together with a stamp for return postage. Write plain; do not use pencil or pale ink; be brief.

Remember that all business committed to our care, and all consultations, are kept by us secret, and strictly confidential.

Caveats.

A Caveat is a confidential communication made to the Patent Office, and is therefore filed within its secret archives. The privilege secured under a caveat is, that it entitles the caveator to receive notice, for a period of one year, of any application for a patent subsequently filed, and which is adjudged to be novel, and is likely to interfere with the invention described in the caveat, and the caveator is then required to complete his application for a patent within three months from the date of said notice. Caveat papers should be very carefully prepared. Our fee for the service varies from $10 to $20. The Government fee under the new law is reduced to ten dollars; and this sum does not apply, as heretofore, as part of the fee on presenting an application for a patent.

Inventors will ofttimes find it very important to take advantage of the caveat system—the expense under the law being comparatively small.

To enable us to prepare caveat paper, we only require a sketch and description of the invention; no model being necessary.

Expense of Applying for a Patent, Rejections, etc.

Under the new law, the Government fee, on filing an application for a patent, is fifteen dollars; and if the patent is allowed, fifty dollars additional is required. If rejected, the first fee of fifteen dollars is all that is demanded. English, French, Austrian, Prussian Spanish, and Inventors of every nationality, may now obtain patents in the United States upon the same terms as our own citizens. The only discrimination made is against subjects of government that discriminate against the inhabitants of the United States.

To the foregoing official fees must be added the Attorney's fees for preparing the various documents and drawings. Our charge for preparing a case, procuring it to the Government, and attending to all business connected with it, until a decision is given, is from $20 to $40. If the patent is granted no further agency expenses ensues. If the application is rejected we cause thorough investigation to be made into the reasons presented to the Commissioner for refusing the patent. In making this examination, our Washington agent has access to all the drawings, models, books and specifications cited in reference, and we report the result as early as possible to our client.

If the rejection proves to be an unjust one—which sometimes happens—it can generally be reversed, and the patent obtained by contesting the case. For this prosecution we charge a fee proportionate to the extra labor involved, payable only on the issue of the patent; but our demand will be reasonable and satisfactory to our clients, and will be arranged beforehand by special agreement.

The system adopted by us works well, gives general satisfaction, and presents to all applicants, however poor, the equal opportunity of having their patent cases prepared, conducted and prosecuted in the best manner, by experienced attorney's, upon the most moderate terms. Inventors who have rejected cases, prepared either by themselves, or for them by other agents, and desire to ascertain the prospects of success by further efforts, are invited to avail themselves of our unequalled facilities in securing favorable results. We have been successful in securing Letters Patent in many cases of such a matter. Our terms fe such cases are very moderate.

Models, Remittances, etc.

The law requires that the Inventor shall, in all cases, furnish a model, which must not exceed twelve inches in any of its dimensions; it should be neatly made, of hard wood or metal, or both, varnished or painted; the name of the inventor should be engraved or painted on it conspicuously.

When the invention consists of an improvement on some known machine, a full working model of the whole will not be necessary. It should be sufficiently perfect, however, to show, with clearness, the nature and operation of the invention.

As soon as the model is ready, it should be carefully boxed and shipped by express or otherwise, to our address, namely: Dewey & Co., Mining and Scientific Press, No. 505 Clay Street, corner of Sansome, San Francisco, Cal. Prepay expenses and send express receipt to us by mail.

Simultaneously with the model, the inventor should send us the first installment of the Government fee, fifteen dollars. The money may be forwarded either by express with the model, or by mail. The safest way to remit is by draft on San Francisco, payable to our order. Always send a letter with the model, and also the remittance stating the name and address of the sender.

A full description should also be sent with the model, embodying all the ideas of the inventor respecting the improvement.

On the receipt of the model and Government fee, the case is duly registered upon our books, and the application proceeded with as fast as possible. When the documents are ready we send them to the inventor by mail, for his examination, signature and affidavit, with a letter of instruction, etc. Our fee for preparing the case is then due and will be called for. The case will then be presented to the Patent Office, and as soon as the patent is ordered to be issued the Government fee, namely, twenty dollars.

Inventors who do business with us will be notified of the state of their application in the Patent Office, when it is possible for us to do so. We do not require the personal attendance of the inventor, unless it is one of great complication; the business can be well done by correspondence.

When the invention consists of a new article of manufacture, or a new composition, samples of the separate ingredients, sufficient to make the experiment, and also of the manufactured article itself must be furnished.

The average time required to procure a patent, when the case is conducted at our agency, is three months. We frequently get them through in less time; but in other cases, owing to delay on the part of officials, the period is sometimes extended to four or five months, and even more. We make a special point to forward our cases as rapidly as possible.

Patent Office Fees, and How Payable.

Nearly all the fees payable to the Patent Office are positively required by law to be paid in advance.

The following is the Government tariff of fees established by law:

On every application for a design, for 3 yrs and 6 mos...	$10
On every application for a design, for seven years.....	15
On every application for a design, for fourteen years.....	30
On every application for a patent, for seventeen years...	15
On every caveat.....	10
On issuing each original patent.....	20
On filing a disclaimer.....	10
On every application for a re-issue.....	30
On every additional patent granted on a re-issue.....	30
On every application for an extension.....	50
On the grant of every extension.....	50
On appeal to the Commissioner from Examiners-in-chief	20
On every appeal to the Judges of Circuit Court, D. C....	25

We have had successful experience in conducting these appeals and our services are rendered on moderate terms.

N. B.—We make out our own forms for applications, etc., and would respectully inform all parties that we have no printed blank forms for sale.

It is Impossible for editors to know ALL the merits and demerits of their correspondence, consequently the reader must not receive the opinions of our contributors as our own. Intelligent discussion is invited upon all sides and the evidence of any error which may appear will be received in friendship and treated with respect.

American and Foreign Patents.—Letters Patent for Inventors can be secured in the United States and foreign countries through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past two years.

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the MINING AND SCIENTIFIC PRESS, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

Payment in Advance.—This paper will not be sent to subscribers beyond the term paid for. The publishers well know that a good journal cannot be sustained on the credit system.

Mr. Wm. R. Bradshaw, is our Special Correspondent and Traveling Agent. All favors or assistance rendered him in his progress through the country in behalf of our journal, will be duly acknowledged.
SAN FRANCISCO, Jan 1st, 1866.

Mr. A. C. Knox, is our fully authorized Traveling Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office.
SAN FRANCISCO, Jan 11th, 1866.

Mr. I. N. Hudson, is authorized to solicit subscriptions, advertising, etc., for the MINING AND SCIENTIFIC PRESS, in San Francisco, and to receipt for the same.

San Francisco:
Saturday Morning, April 14, 1866.

Look Out for Illegal Advertising!

All assessments of corporations levied on, or subsequent to, March 26th, are governed by the new law approved on that day. We notice that some of our important mining companies are advertising their assessments illegally in the daily and weekly press of this State. As the new law is more liberal in its provisions for advertising than the Act of 1864, these companies have yet time to retrace their steps and begin anew and right. We speak of the matter for the benefit of all concerned. We have prepared a set of correct blank forms for advertising assessments, which we furnish free on application at our office, together with rules for advertising and copies of the new law.

Judicious Resolutions.

Several of our most substantial and judiciously managed mining corporations have passed resolutions, since the approval of the new assessment law, requiring all notice of assessments and sales to be published in the MINING AND SCIENTIFIC PRESS, the only thorough (daily or weekly) mining journal on this coast. Our efforts to concentrate all mining advertisements in one paper, for the economical convenience of shareholders and assessment payers, are meeting with decided success. Those who believe in supporting the mining cause, should bear our paper in mind, and bring up this subject at the next trustee or shareholders' meeting.
San Francisco, April 7th, 1866.

Mining Laws of 1866.

It is our intention to issue, in cheap pamphlet form, previous to May 1st, a full and correct copy of all laws relating to mining adopted by the California and Nevada State Legislatures of 1866. Some of these Acts are of vital importance to every citizen interested in mining.—April 1st, 1866.

ALUM MINES.—The Clear Lake *Times* tells of the discovery of an alum mine, or deposit of alum, in that region. A correspondent writes to the *Times*: "I have about one pound of pure alum, beautifully crystalized, obtained from the imperfect washing of six or seven pounds of aluminous clay, which was taken from the Kelsey Creek alum bank. The bank is most favorably located for working."

THE QUARTZ MINES OF GRASS VALLEY.

The magnitude of the quartz mining interest of California is just beginning to be approximately realized by capitalists abroad. The unfortunate results of the early attempts at that description of mining in this State, particularly those in Mariposa county, where the advantages of ample capital, the highest scientific acquirements and the most experienced skill attainable was freely brought to bear, produced such a discouraging effect upon the business, as for a time to quite deter any further investment of foreign capital in that direction. Even our own capitalists could not for a long time thereafter be induced to look with any considerable degree of favor upon quartz mining; and, up to the Washoe discovery, the fact that a San Francisco merchant was known to be investing in quartz, was quite sufficient to ruin his credit throughout the entire mercantile community.

In the meantime, however, a few men of means in Nevada and Amador counties, quietly but perseveringly continued their operations, with varied success and under most discouraging circumstances, until by the gradual depreciation of labor and materials, the cost of raising and crushing rock was reduced to a paying basis. About the time this period in the history of the business had arrived, the world was suddenly startled by the wonderful silver discoveries on the Comstock lode in Washoe.

The extraordinary yield of the surface ores at the points first opened upon that lode, produced a complete revolution among the hitherto doubting money-changers of San Francisco. The consequence was a general rush for the new mines—large fortunes for a few, and utter ruin for the many. Several years passed by and stocks which had gone up, under the excitement, to thousands of dollars per foot, suddenly fell to as many hundreds; while the great majority of them became utterly valueless—not worth even the paper upon which they were printed.

In the meantime, most of the old pioneer quartz men of Grass Valley, continued on in the quiet, even tenor of their way, working cautiously and economically, and going down gradually with their inclines, so fast only as the mines themselves would pay the way; carefully eschewing assessments, and avoiding costly structures, for mill houses or superintendents' dwellings, and employing no managers in either mill or mines, but men of experience and skill. The result of such a policy was that when the crash came upon Washoe, the mines of Grass Valley shone forth in their true colors, growing richer as the work progressed in depth, and exhibiting to the world a record of steady, onward progress, and a development of permanence nowhere exceeded in the whole history of mining. All this was accomplished, almost without a dollar of foreign capital; that which has since gone there has been attracted thither by actual developments, and has been expended with the view of permanent and productive investment.

In taking a general survey of the field of quartz operations throughout the State, the mines appear to be grouped together at intervals along a belt of country, extending about 400 miles in length and occupying the entire western flank of the Sierra Nevada mountains, from their very summit quite down to the foothills. These groups, so far as present explorations have gone, are widely separated; although it is far from certain that even the intervening country may not contain almost innumerable groups of greater or less degree of value.

The most valuable and thoroughly prospected of these groups is that at Grass Valley. The altitude of those mines is about 2500 feet. Their geological association is greenstone and syenite, with a heavy belt of serpentine on the north, separating it from the mines of Nevada, still further north, and which are mostly located in granite. So far as explorations have been made, no other district in California, or elsewhere, has ever been found to equal this group in either the number or richness of its mines. As a general thing these veins have a northerly and southerly direction; but the rule is far from universal. In fact some of the most valuable, as the Eureka, for instance, is almost due east and west; the Lucky, Cambridge, North Star and others of equal value, are nearly so. They are all isolated, and not continuous. When accurately delineated upon a map, a work which is now being done with great care and at much expense, they present every variety of direction, inclination, dip and angle. One, in particular, and perhaps the richest of the group, presents walls and dip almost like the walls of a bowl from which about one-third of its circumference has been removed.

We are led to infer from these facts, and contrary to the generally received opinion, that the peculiarities mentioned are of no value whatever in determining the paying qualities of a lode. The formation of the lodes, and the aggregation of the mineral is undoubtedly due to the character of the country rock. How they have been aggregated is a mere matter of speculation. The most essential point is to find a group so aggregated and well filled with mineral. The explorations already made are such as to set at rest all doubts as to their permanence; and to warrant the most liberal outlay of capital in providing machinery to follow them down to an indefinite depth. The lowest point yet reached in Grass Valley is a little over 300 feet; but the Eureka mine, in Amador county, has been followed down more than 1000 feet in depth, at which point this, as well as all the deep mines in Grass Valley, is found to pay equally well as at any point above, while the constant decrease in the cost of working, by the diminution in the price of labor and the improvement in machinery and skill for saving the precious metal, more than compensates for the increased cost of mining at a greater depth.

One of the most noticeable and important features in Grass Valley is the fact that not a single failure has occurred to find pay ore where any considerable depth has been attained; and nearly every mine has paid its own way from the start. The mines of Grass Valley have been developed without any of the cumbrous machinery necessary to incorporated companies, with their salaried officers and monthly or quarterly calls for assessments. There is not another locality on the globe, in which so much mining has been done, where the same record can be shown. These simple facts are sufficient to establish the pre-eminence of Grass Valley over all other localities as a place for the permanent investment of capital.

In saying thus much of that locality, we are not aware that we are speaking disparagingly of any other quartz mining section in California. If we are not mistaken, there is not a quartz mine in the entire State, which has been opened to the depth of the deepest mines in Grass Valley—say three hundred feet—which is not to-day a paying mine. These facts—and we believe they *are* facts—ought to open the minds of capitalists everywhere, to the value of the gold mines of California as an illimitable field for the permanent investment of capital.

HUNTER'S CONCENTRATOR.—Mr. Hunter, of this city, has recently spent several months in Grass Valley, giving his machine for concentrating sulphurets, a thorough practical test. The result of his experiments has been several important modifications and improvements over the machine, as hitherto constructed, by which its efficiency is said to be enhanced, while its cost has been greatly decreased. He is now constructing several of these machines which are to be placed in the new mill of the Empire Company, now in process of erection at Grass Valley. We may shortly give a full and illustrated description of this concentrator, with the latest improvements and modifications.

The commercial importance of Cincinnati may be figured from the value of some of the leading reports of 1865, as follows: Iron, $5,405,936; cotton, $32,103,470; coal, $6,584,062; petroleum, $1,120,350; salt, $1,184,736.

OIL WELLS IN BURMAH.

It is quite well known that the European market has been supplied with petroleum or rock oil from Burmah for many centuries; but the impression has generally prevailed that the supply has been derived from springs. Such, however, is not the case. Oil wells, similar to wells dug for water, have been used from time immemorial for supplying the market with this useful substance, which, however, until quite recently, has generally been used in its crude state. The Rev. Howard Malcom, who visited the vicinity of some of the wells situated near a village in the river Irrawaddy, and some 300 miles from its mouth, gives a very interesting and probably the most reliable account of them ever published. We give the following extract from one of his letters, dated June 28th, 1836, some twenty years anterior to the sinking of the first oil well in Pennsylvania:

The wells are two miles from the village. The road to them is well beaten by bullock carts, often crossing the bed of the torrent (now dry) whence the village derives its name. A more rugged and desolate region can scarcely be imagined. The rocks are sandstone, puddingstone and petrifactions; the soil, sand and blue clay. Small hills on every side rise abruptly, like waves in a chaffed sea, sterile and unsightly.

The wells are very numerous, said to be more than 400, occupying a space of about twelve square miles. They are from 200 to 300 feet deep, of small calibre, and sustained by scantling. The temperature of the oil when first raised to the top is 89°. Men do not go down, but an earthen pot is lowered in and drawn up over a beam across the mouth, by two men running off with the rope. The pot is emptied into a little pool, where the water with which it is largely mixed subsides, and the oil is drawn off pure. It is exported in earthen jars containing about thirty pounds. The price now, including the pots, is about a tical for 2½ viss, or about fifty cents for ten pounds. A well yields about 400 or 500 viss per day, and is worked by three or four men. Sometimes 700 are obtained. Each well gives a daily average of 150 gallons. The gross annual product is eighty million pounds.

This most useful oil is very extensively used for lamps and torches, and is exported to all parts of Europe where it can be taken by water. It is also used for preserving wood, mat partitions, palm-leaf books, etc., from insects and from the weather, and is an admirable article for these purposes. Even white ants will not attack wood which has been brushed with it. A boat's bottom kept properly in order with it is about as safe as if coppered.

It would appear, from the above, that the oil regions of Burmah are very similar in character to those of California. Flowing wells do not appear to have been found there; but a great number of openings are made by sinking wells into the oil strata, into which the oil percolates with the water, and from which both are drawn up and separated as above described. Such wells resemble what are here called "pumping wells." Present developments appear to indicate that a similar mode of operation will have to be adopted in California for obtaining petroleum; pumps will, however, be employed here instead of the primitive mode of raising the water employed in Burmah, and the augur will be used instead of the shovel for sinking the wells. The wells of Burmah have been worked for centuries, and there is every reason for believing that those of California will be equally permanent. There can be no doubt but that with our superior appliances they can be made profitable. It is not necessary that we should find flowing wells here to make the business pay, albeit such developments would be most welcome to the oil-seekers.

BULLION FROM REESE RIVER.—We learn from the *Reveille* that the amount of bullion shipped by Wells, Fargo & Co., from Austin, Reese River, during the month of March, was was $33,980 in value, weighing 1,926 pounds. The National Bank of Austin shipped during the same time bullion to the amount of $35,113.

RICH ROCK.—A single blast was let off a few days since in the Enterprise claim, Excelsior district, which threw out seven tons of as rich rock as is often seen in any part of the country. So says the Virginia *Enterprise*.

Queries.

Editors Mining and Scientific Press:—I notice in the editorial columns of the *Miner* for April the following statement: "Gold has no affinity whatever for sulphur, and, therefore, never chemically unites with it."

Will the author of this statement be kind enough to inform us what constitutes the black precipitate which is obtained, as every tyro in chemistry knows, when hydrosulphuric acid is added to a solution of terchlorid of gold?

I should also be grateful for a little information from the writer of an editorial in the same paper, upon *Emery* and *Emerylite*. In that article, specimens which are called "true Emerylite" are described as being nearly or quite black, and as having "much the appearance of the fracture of coarse grained cast iron after it has been exposed to the atmosphere till it has lost its brightness," or as "presenting much the same appearance as a mass of coarse iron sand, such as is usually found when 'panning out,' which has been heated sufficiently to combine the grains without melting them." It is also stated that the same mineral is nearly twice as heavy as common quartz rock, that it will scratch glass, but will not mark quartz, and that it consists of about 50 per cent. of alumina, 30 per cent. of silica and 7 per cent. of iron, the remainder being lime, water, and soda.

Now Dana states that Emerylite is *foliated* like mica, that it occurs either in coarse plates or in masses consisting of aggregate *spangles*, that its color is white, that its hardness is 3.5 to 4.5, and its specific gravity 2.995. The hardness given by Dana then for Emerylite, is *not* sufficient to scratch glass, and the specific gravity would make it only about one and one-seventh times as heavy as quartz. Moreover, in six out of eight analyses of this mineral given by Dana, no iron was detected, and of the other two analyses, in one there was but a *trace* of iron, and in the other considerably less than 3 per cent., while the smallest proportion of lime in any one of the eight analyses was over 9 per cent.

Since the two preceding descriptions differ, then, in so marked a manner, both as to physical properties and chemical composition, will the writer of the article referred to, inform us upon what grounds he decided the mineral in question to be Emerylite?

As the organ of the "Mining Bureau" is supposed to be reliable in scientific matters, I should like to see the *modus operandi* by which these descriptions are reconciled, or Dana proved wrong, as the case may be.

Enquirer.

The Ring Suspended by a Burnt Thread. Dissolve a teaspoonful of salt in a wine-glassful of water, and place in it some coarse sewing cotton; in about an hour take out the thread and dry it. Tie a piece of this prepared cotton to a small ring, about the size of a wedding ring; hold it up, and set fire to the thread. When it has burnt out the ring will not fall, but remain suspended to the astonishment of all beholders. Philosophers account for this effect by stating that the salt in the thread forms, with the ashes of the cotton, a fine film of glass, which is strong enough to support the ring, or any other small weight.

Curious Experiment.—Procure a basin of milk-warm water, throw into it half-a-dozen pieces of camphor about the size of a pea; they will soon begin to move, and acquire a rotary and progressive motion, which will continue for a considerable time. If now, one drop of oil of turpentine, or sweet oil, or even of gin (if allowed on the premises), be let fall upon the water, the pieces of camphor will dart away, and be deprived of their motion and vivacity. Little pieces of cork, that have been soaked in ether, act much in the same way as camphor, when thrown upon water. Camphor, being highly combustible, will burn if ignited while floating upon water, producing a singular effect, reminding one of the lamps which the Hindoo maidens cast upon the waters of the Ganges as mystic messengers to their distant lovers, or to their spirits after death.

Annual Report of the Commissioner of Patents.

The Annual Report of the Commissioner of Patents has just been completed. From it is inferred that during the last year the prosperity of that office was unprecedented, and the business has increased to such an extent that more clerks and additional rooms are necessary. The subjoined statement of the receipts and expenditures of this office for the year 1856, and the condition of the Patent Fund at its close, will give an idea of the immense business that has been transacted:

Number of applications for patents during the year	10,664
Number of patents issued, including re-issues and designs	6,616
Number of caveats filed	1,937
Number of applications for extension of patents	78
Number of patents extended	61
Number of patents expired, December 31st, 1865	914

Of the patents granted, there were, to—

Citizens of the United States	6,423
Subjects of Great Britain	82
Subjects of the French empire	40
Subjects of other Foreign Governments	60

Statement of money received during the year, namely:

On application for patents, re-issues, etc.	$321,572 20
For copies and for recording	27 219.64
Total	$348,791.84

Statements of expenditures from the Patent Fund:

For Salaries	$100,032.54
Contingent expenses	75,244.43
Temporary clerks	97,453.37
Withdrawals	420.00
Refunding money paid by mistake	649 00
Judges in appeal cases	400.00
Total expended	$274,199.34

Statement of the Patent Fund—

Amount to the credit of the Patent Fund January 1st, 1865	$55,592 29
Amount of receipts during the year	348,791.84
Total	$404,384.12
Leaving to the credit of the Patent Fund January 1st, 1866, the sum of	130,184.78
Surplus of receipts over expenditures	74,592.50

The unprecedented activity of the mechanical industry of the country, since the close of the war, is strikingly manifested by a comparison of the business of this office for the last with that of the year previous:

During 1864, the number of 6,972 applications for patents were filed, against 10,664 for 1865; 1,063 caveats filed against 1,937—the increase is most unprecedented.

Beautiful Things are suggestive of purity. They have a delightfulness that wins us, an excellence which we can but admire and reverence. Beautiful works of art or the beautiful things of nature alike inspire this ennobling feeling. All may thus be benefited. Those of our young friends who are not blessed with parents that are wealthy and able to adorn their dwellings and grounds with works of art, may nevertheless freely indulge their modest aspirations by cultivating flowers.

Keep a vase of flowers on your table. Nothing is more beautiful, and few things will help more to cultivate your taste for the elegant or maintain your dignity among your friends and neighbors. A taste for such things should early be cultivated. It will secure for you, consideration among your associates, and inspire you with every ennobling principle.

Who ever saw a cottage ornamented with flowers that was not the abode of thrift and happiness? The children of such a household will ever be noted for their kindness, intelligence and gentleness. Trees and flowers are so interwoven with our ideas of beauty and comfort, as to be almost inseperable from a pleasant, happy home. A palace of a house, with all its noble proportions, its rich adornments, its spacious apartments and its costly furniture, but without the surroundings of the flower-encircled cottage, is comparatively cold and cheerless. Give us a little domestic Eden for our ideal of home comfort. Let our young friends strive to cultivate a similar taste in their childhood, and in after life they will find it far more productive of happiness than silver or gold.

Varney's Concentrator.—The new concentrator recently invented by Mr. Varney, and exhibited at his place on First street, in this city, is attracting much attention from millmen. It will soon be put to a practical test at one of the mills in Grass Valley. We shall give an illustrated description of it as soon as the necessary engraving can be prepared.

Interesting Petroleum Discovery in West Virginia.—We are permitted to make the following interesting extract from a letter received per last steamer by Prof. Rowlandson, of this city, from Prof. Chas. S. Richardson, of New York. The locality referred to is near Parkersburg, West Virginia:

"We have been making some extraordinary developments here the last six months; we have wells producing 200 barrels of heavy lubricating oil per day, worth $40 per barrel [ordinary petroleum is worth about $10 per barrel—Ed. Press]; almost every week some strike is made. There is, of course, much excitement. We have one oil mine; it is a beautiful lode, four and a half feet thick, with a dip mostly vertical, and filled in with solid chrystalized petroleum. It yields, under dry distillation, 165 gallons of oil to the ton. It is not asphalte, nor bitumen; but, of course, has the same properties. It is granulous in structure; is insoluble in acids or alkalies. Boiling nitric acid has no effect upon it. It gives way to chloroform, which is the only solvent for it we know of at present. It is rich in perfume and produces olefiant gas. I will send you a report in a short time (illustrated) that will give you an outline of the district where it occurs."

Auction of Ladies.—It is well known that an auction of unmarried ladies used to take place annually in Babylon. In every district they assembled on a certain day of every year all the virgins of marriageable age. The most beautiful was first put up, and the man who bid the largest sum of money gained possession of her. The second in personal appearance followed, and the bidders gratified themselves with handsome wives according to the depth of their purses. But alas! it seems that there were in Babylon some ladies for whom no money was likely to be offered; yet these were also disposed of, so provident were the Babylonians. When all the beautiful virgins were sold, the crier ordered the most deformed to stand up, and after he had openly demanded who would marry her for a small sum, she was at length adjudged to the man who would be satisfied with the least; and in this way the money arising from the sale of the handsome served as a portion to those who were either of disagreeable looks, or that had any imperfection. This custom prevailed about five hundred years before Christ.

The Statue of Lincoln, by Mezzara, which is to be permanently placed in front of the Lincoln School House, will be inaugurated to-day next, the first anniversary of that patriot's assassination.

Pahranagat.—The *Reveille* says that Mr. C. H. Belknap, who has recently returned to Austin from Pahranagat, brings highly favorable reports from those mines.

The oil production of the Atlantic States is rapidly increasing, while the known oil fields are increasing in still greater ratio.

An Egyptian harp found in Thebes, had strings yet perfect enough to vibrate again, after a silence of 3000 years.

"Safety Cages."

(PATENT GRANTED.)

MINING COMPANIES

Will find it to their interest to adopt "Berry, Hochholzer & Denver's Safety Cage" in their hoisting works. It requires very little more work to manufacture than the ordinary style of cages—any blacksmith can make it. It has been PROVED TO BE PERFECTLY SAFE, is self-acting and very light, and will, in the item of rope alone, pay for itself in a short time.

The proprietors refer to the following mining companies, among others, that are now using this Safety Cage:—Gould & Curry, Savage, Ophir, Mexican, Empire, Overman and Justis.

For particulars and terms, apply to

HUGO HOCHHOLZER,
Virginia City, Nevada.
15v11tf Through Wells, Fargo & Co's Express.

Union Amalgamator.

This Valuable Invention

Is fast finding its way into general use, not by means of combination of capital and influence, but on the strength of its own merits, and upon the principle that what is known to be good will be appreciated. Practical men acknowledge the UNION PAN to be scientific, the best, the cheapest, and most profitable. It now stands first on the list of all pans in use for the purpose of

Working Gold and Silver Ores.

It has been found that a low class of ores, also tailings from Mills, Sulphurets, etc., that will not pay to work with the common pans, may be worked with this and obtain large profits. The UNION PAN is manufactured in two sizes, and capable of operating upon large quantities of ore in the most efficient manner.

Parties interested in Quartz Mining, Mills, etc., will find it to their advantage to call and examine for themselves, and see its operation.

Gold and silver ores tested by regular mill process, at moderate cost, by

STRONG & CO.,
San Francisco Foundry, corner Mission and Fremont streets, where orders will receive prompt attention.

A Fighting School Marm.—Some trouble and a law suit regarding the punishment of a scholar occurred last week in the District of Orange Center, in which right prevailed so triumphantly that it deserves especial notice. The teacher, Miss Emily Batchelder, of East Montpelier, with the volunteer assistance of one of the boys in School, punished a large and unruly scholar (who was endeavoring to make a fuss in School and defy the the teacher,) so severely that he begged for mercy, and his father prosecuted the teacher. The doctor called to examine the "abused" boy, stated that he evidently was pretty well punished, but he thought not quite what he had deserved. An attempt was made to procure a jury, but a man could not be found who had not "formed an opinion," which was "that he wan't licked half enough." Seeing what the inevitable result of a trial must be, the prosecution finally withdrew the suit, when a collection was taken up which paid all the expenses to which Miss Batchelder had been subjected, and presented her, in behalf of the ladies of the district, with a set of silver table spoons and butter knife, indicating that the district was hearty and true in the support of a teacher who had fearlessly done her duty.—*Montpelier (Vt.) Freeman.*

How to Have a Sharp Razor.—Take a strip of thick harness leather, the size you want for a strap, and fasten it at each end upon a piece of wood; then rub upon its surface a piece of tin (any tin dish will do) until it is smooth. Strop your razor upon this, and you will find it worth all the patent strops that were ever invented.—*Portland American.*

EUROPEAN
METALLURGICAL WORKS,
—AND—
Practical Mining School,
Bryant Street, Between Third and Fourth,
SAN FRANCISCO.

The Proprietors are at all times prepared to work or test Ores sent to this establishment—either in large or small quantities—by such process as may be found best adapted to their chemical character, after a careful analysis has been made. Test lots of Ore adapted to the smelting process attended to. Sulphuret, pyritous, and the (so-called) "rebellious ores," are having especial attention paid to their successful treatment. Assaying in the humid and dry way. Also, refining by cupellation, done at moderate rates.

PRACTICAL MINING SCHOOL.

The proprietors—encouraged by numerous applications from gentlemen desirous of pursuing the study of practical metallurgy—have concluded to admit parties on reasonable terms. Having in their Mill all the necessary appliances for crushing, roasting, amalgamating, smelting, refining and assaying, as also a well extended Laboratory for the analysis of Ores and Minerals, a good opportunity is here offered to acquire a sound practical knowledge of the business.

CAUTION.

To whom it may concern:—The public are hereby notified that a patent was allowed, December 27th, 1864, and issued June 27th, 1865, to Professor Henry Wurtz, for the use of sodium and amalgams thereof with quicksilver, in the extraction of precious metals from their ores. All persons using said amalgams, or purchasing or selling sodium or said amalgams for use in the treatment of gold or silver ores, are hereby cautioned that they will be prosecuted to the full extent of the law.

The patents of Professor Wurtz have been assigned to the Wurtz Amalgamation Company of New York city. It is the intention of the said company soon to appoint agents for California and the other mining States and Territories. In the meantime, applications for licenses to use sodium and its amalgams, may be addressed to the company, at their office, No. 57 Broadway, New York.

C. Elton Buck, Secretary.
March 9th, 1866. 14v12-6t

Engraved to Order.—Persons who desire to illustrate their individual establishments or business, should give us their orders for Engraving and Printing, and we will guarantee good work and reasonable prices.

Money by Mail.—Subscribers and advertisers remitting us money in less sums than $50, can do so by mail at our risk, if they will register their letters; we will take no risk on unregistered letters, or letters by express. Remittances by express must be prepaid

Subscribers who do not receive the Mining and Scientific Press in due time, are requested to inform the publishers.

BREAD AND BUTTER.—Hall, in his *Journal of Health*, gives us the following bit of wisdom: "Bread and butter are the only articles of food of which we never tire from early childhood to old age. A pound of fine flour or Indian meal contains three times as much meat as one pound of butchers' roast beef, and if the whole product of the grain, bran and all, were made into bread, fifteen per cent. more nutriment would be added. Unfortunately the bran, the coarsest part, is thrown away; the very part which gives soundness to the teeth and strength to the brain. Five hundred pounds of flour gives the body thirty pounds of the bony element, while the same quantity of bran gives more than one hundred and twenty-five pounds. This bone is lime, the phosphate of lime, the indispensable element of health to the whole human body, from the want of the natural supply of which multitudes of persons go into a general decline. But swallowing phosphorus in the shape of powders or in syrups, to cure these declines, has little or no effect. The articles contained in these phosphates must pass through Nature's laboratory, in alembics specially prepared by Almighty power, in order to impart their peculiar virtues to the human frame; in plainer phrase, the shortest, safest, and most infallible method of giving strength to the body, bone and brain, thereby arresting disease, building up the constitution, is to eat and digest more bread made out of the whole grain, whether made of wheat corn, rye, or oats.

A CORRESPONDENT writes that a 'learned professor,' who was asked to give a lecture to an institution, went and delivered his eloquence at that institution, and only when it was over, found that his best language and longest words had been expended in vain, as he was in the presence of a deaf and dumb college.

A Business Compliment.

PETALUMA, Oct. 4, 1865.

MESSRS. DEWEY & CO.—Gentlemen: Your note informing me that my patent for Crushing and Baling Machine is ordered to issue is at hand. Please accept my thanks for the prompt and business like manner with which the case has been conducted, and inclosed find twenty dollars for balance Government fees. Respectfully, etc.

JACOB PRICE.

UNION IRON WORKS!
Corner First and Mission streets,
SAN FRANCISCO.

ESTABLISHED IN 1849.

HAVING INCREASED OUR FACILITIES IN EVERY Department, we are now prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps of all kinds, Hoisting Gear, Cas Work, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic, Hay, Rag, Screw and Drop Presses, Coining Machinery, Pile Drivers, Bark and Malt Mills, and all kinds of Castings.

Engines.

Marine Engines, Oscillating and Beam; Stern and Side Wheel Boats, Locomotives, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott and Eckart's Adjustable Cut-off Regulator—best in use; W. R. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pump and Fire Engine.

Boilers.

Locomotive, Flue, Tubular, Upright, Cylinder and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.

Amalgamating Machinery.

Wheeler & Randall's improved Tractory Curve Pan, Zeuas Wheeler's improved flat bottom pan, Beldin's pan, Veatch's tubs, Prater's concentrators, Waklee's pans, Beers' pan, German Barrels, Arastra Gearing, Chile Mills. Setters of all descriptions, Retorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Cams, Pans and Pebs.

BLAKE'S PATENT QUARTZ CRUSHERS, of all sizes.

Oil Boring Tools and Machinery,

Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania.

We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.

Russia Iron Screens, of all degrees of fineness and of all qualities of iron.

All work done in the best manner at the lowest cash prices.

PHILADELPHIA AGENCY,

Parties wishing to subscribe or advertise in the MINING AND SCIENTIFIC PRESS can be accommodated by calling upon our Agent, Mr. THANEA HAMILTON, at the Assembly Building, 106 South Tenth street, Philadelphia, Pa., where sample copies of our publications can always be found.

Economy in Advertising.—The MINING AND SCIENTIFIC PRESS is the best and most ECONOMICAL mining advertising medium in this city. Our terms are less than ONE HALF the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The PRESS contains, proportionally, a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

Mining Notices--Continued.

New Mining Advertisements to be found under another heading.

Arroyo Seco Copper Mining Company, No. 1.—Location: Amador County, California.

NOTICE.—The annual meeting of stockholders of the above named company, for the election of Trustees, to serve for the ensuing year, will be held on THURSDAY, the 19th day of April, 1866, at one o'clock P. M., at their office, 415 Montgomery street.

R. WEGENER, Secretary.

San Francisco, April 3d, 1866. ap7

Batoplias Mining Company, Batoplias District State of Chihuahua, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 4th day of April, 1866, an assessment (No. 2) of twenty-five (25) cents per share was levied upon the assessable capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, No. 611 Montgomery street, up stairs.

Any stock upon which said assessment shall remain unpaid on the 10th day of May, 1866, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 28th day of May, 1866, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

A. MARTINON, Secretary.

Office, 611 Montgomery Street, San Francisco, Cal. ap7

Cosala Silver Mining Company, District of Cosala, Sinaloa, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of the Cosala Silver Mining company, held on Saturday, the 24th day of March, 1866, at the office of the company, an assessment of one dollar ($1) per share was levied on each and every assessable share of the capital stock of said company, payable immediately in gold coin of the United States of America, to the Secretary, at the office of the company, No. 510 Battery street, San Francisco.

Any stock upon which said assessment shall remain unpaid on Thursday, the 26th day of April, 1866, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 12th day of May, 1866, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

CHAS. BAUM, Secretary.

No. 510 Battery street, opposite the Custom House, San Francisco. mar31

Comet Petroleum Company, Mattole District, Humboldt County, Cal.

NOTICE.—There are delinquent upon the following described stock, on account of assessment levied on the twenty-second (22d) day of January, 1866, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
S M Balch	1	25	$7 50
S M Balch	23	50	15 00
Warren J Chapman	2	12	3 60
R I. Holman	3	13	3 90

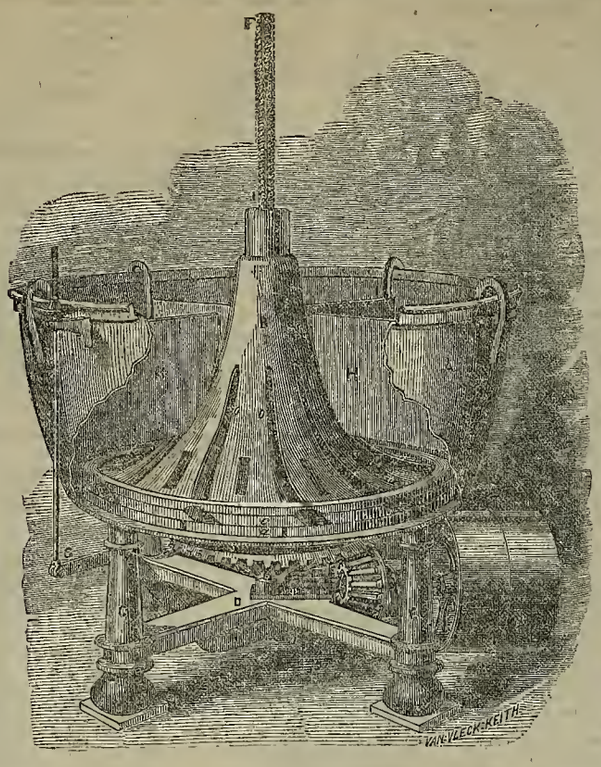
JAVA COFFEE AND PEPPER.—In extent Java is about 700 miles in length, and it varies from 80 to 140 miles in width. Its area is less than 20,000 square miles. The face of the country is more or less broken by mountains, but the soil generally is rich and productive. The products are rice, sugar, coffee, pepper, spices, and a profusion of the finest tropical fruit. Coffee is cultivated to as great perfection as almost in any other part of the world. It grows upon large bushes, and the grains of coffee are formed two in a berry about the size and shape of our common plum. The skin of the berry is about as thick as that of the plum, and the color, when ripe, is a pale scarlet.

The bush is very productive. Every branch is loaded with the berries, which grow two in a place on the opposite side of each other, and about an inch and a half apart. When ripe, the skin bursts open and the grains of coffee fall out upon the ground; but a more general way is to spread something under the bush and shake the coffee down. After the outer skin is taken off there remains a kind of husk over each kernel, which is broken off (after being well dried in the sun) by heavy rollers. The coffee after this needs winnowing in order to be freed from the broken particles of the bush. It has been said by some writers that one bush with another will not yield more than a pound of coffee.

Black pepper is also raised to some extent on the Island of Java; but Sumatra, which lies just across the straits, is by far the most celebrated for this commodity. Her pepper is, perhaps, the finest and most abundant of any one country in the world. Black pepper grows on a vine very much like our grape vine. The pepper grows and looks when grown very much like our red currants. There is this difference, however, the currant has each its own distinct stem, but the pepper has not; every grain grows hard on to one common stem, just as each grain of Indian corn does on the cob. The color of the pepper when first ripe is almost a bright red, and changes to the dead black by being exposed to the heat of the sun.

The white pepper is nothing more than the common black with the outer skin taken off. It is first soaked until the skin bursts open, which is then rubbed off and the grain dried. The white is not considered so pungent as the black, though it is nicer and more expensive, as more labor is necessary in order to prepare it.



THE EXCELSIOR GRINDER AND AMALGAMATOR.

In the engraving herewith presented, A represents the Rim of the Pan; B, Muller; C, Legs; D, Cross-Frame; E, Gearing; F, Screw; G, Lever; H, Dash-Boards; I, Key; *a*, Dies; *c*, Shoes, and *o*, Openings,

The relative grinding capacities of "The Excelsior" Grinder and Amalgamator, of the Flat Bottomed Pan, and of the Conical Pan *when properly constructed*, are respectively 177, 98 and 110.

That is, the respective mullers being of the same diameter, same weight, same hardness, and running at the same velocity "The Excelsior Grinder and Amalgamator" will reduce one hundred and seventy-seven tons of ore, the Flat Bottomed Pan ninety-eight tons, and the Conical Pan one hundred and ten tons to the same degree of fineness in the same time.

The wear to the Shoes and Dies at their grinding surfaces in the Excelsior Grinder and Amalgamator, is perfectly uniform, thus securing evenness of reduction to the pulp, as well as steadiness of motion to the muller. Uniform wear of the grinding plates has been attained in no other than that of the Tractory form—nor can it be.

Another property of excellence in this machine is that the metal or substance to be amalgamated passes *direct* from the grinding surfaces into the quicksilver; thus excluding the possibility of its becoming coated with any foreign substances, after having been burnished. It is truthfully said "that the Tractory-formed Pan as a Grinder has no equal, and as an Amalgamator no superior."

As a whole, it is far superior to any other pan in use.

Important to Californians.—Many inventors have ately had their claims for Patents seriously (and in some cases fatally) delayed by the unqualification of agents who have not complied with the Government license and revenue laws, as well as other new and imperative regulations. These discrepancies, although arising from the inexperience of honest agents, are none the less dangerous to applicants for patents, whose safest course is to trust their business with none but active and experienced solicitors. THE MINING AND SCIENTIFIC PRESS PATENT AGENCY has strictly complied with the requisitions of the Department, and properly filed all necessary papers as Claim Agents.

GEORGE E. BROWN,

(Late Assistant Examiner in the U. S. Patent Office.)

HAVING RESIGNED THAT POSITION AFTER A TENure of office of eighteen months, offers his services to

INVENTORS AND THEIR ASSIGNEES,

—AS A—

Patent Solicitor,

He will make Preliminary Examinations in the Patent Office, with a view to ascertain the Patentability of any invention that may be submitted to him for that purpose; will prepare the necessary papers for those who wish to make Applications for

Patents for their Inventions,

—OR FOR—

EXTENSIONS OR REISSUES OF PATENTS

Already granted; will act as an Attorney in presenting Applications at the Patent Office, and in managing them to a final issue; will draw up Assignments; will examine into the condition of Rejected Applications when desired to do so, and undertake the prosecution of such as may be considered patentable, and do whatever else is usually done by Patent Solicitors.

Address, P. O. Box 257, Washington, D.C. 7v12-3m

THE PULSE.—The action of the pulse will, no doubt, be of much interest to our readers. It probably is not known to many that the pulse of a female exceeds in frequency that of a male from ten to fourteen beats per minute.

Many circumstances influence its action, such as muscular exertion, mental excitement, the state of the digestive organs, and the position of the body, whether lying, sitting, or standing. Muscular action and mental excitement, as also the process of digestion, naturally increase it, it being much quicker during the process of digestion than when digestion has taken place.

In healthy males, from twenty-five to thirty years of age, the average of the pulse per minute, in a standing position, is from seventy-nine to eighty-one; sitting, from seventy-nine to ninety-one, and lying down, from sixty-six to sixty-seven—making a difference of from nine to ten beats between standing and sitting, from four to five between sitting and lying, and from thirteen to fourteen beats between standing and lying. In healthy females, of the same age, it will be found from eighty-two to ninety-one, standing; eighty-one to eighty two sitting, and eighty to eighty-one lying. The variation in the different positions is produced by the muscular action induced by the change of position.

At the different periods of the day the pulse varies, as, for instance, in a healthy person it is most frequent in the morning, and gradually decreases toward evening. After excitement, the diminution is greater and more regular in the evening than in the morning. Food has the same effect on it at these periods, for, in many instances, the same food that will increase its amount and duration in the morning, will, in the evening, have no effect whatever. During the hours of sleep there is a greater diminution.

The following table will show its variations at different periods of life, being greater in childhood than in old age, and gradually diminishing as we grow older:

	Beats per minute.
Newly born infant	130 to 140
During the first year	115 to 130
During the second year	100 to 115
During the third year	90 to 100
At the seventh year	85 to 90
Age of puberty	80 to 85
Manhood	70 to 82
Old age	50 to 65

To Printers.

We have for sale, at a bargain, a Second-hand Half-Medium (largest size), Ruggles' Engine Job-Printing Press, of most approved pattern. It is in excellent condition, and warranted to work as good as new. Apply soon, at the office of the MINING AND SCIENTIFIC PRESS. 19v11tf

BACK VOLUMES.

Back files of the MINING AND SCIENTIFIC PRESS, from January 1st, 1861, to the present time, will be furnished at $3 per volume of six months; bound in cloth, $5

J. B. CONE, BUSINESS AGENCY.—Makes private sales of Property and Business Places of every description, in the city and throughout the State; procures partners with large and small amounts of money; negotiates sales of mining property, and does a General Agency Business. Patronage solicited by mail, express, or by personal application at the office, 402 Montgomery Street, San Francisco, California. 23v11tf

Machinery.

EXCELSIOR DOUBLE ACTING
Suction and Force Pump.

W. D. Hooker's Patent, August 15, 1865.

THE SUBSCRIBERS OFFER FOR SALE the following sizes of the above-named celebrated Pump, acknowledged to be the best Double Acting Pump known to be in use. They are more easily set in position, and are more durable and compact than any other Double Acting Force Pump; they are also worked with very little friction, and have greater lifting power than other pumps of like size. They are adapted to work by hand, wind-mill, horse, or steam-power.

No. 1—Cylinder 2½ in., stroke 6 in.
No. 2—Cylinder 3 in., stroke 7 in.
No. 3—Cylinder 4 in., stroke 10 in.
No. 4—Cylinder 5 in., stroke 15 in.
No. 5—Cylinder 6 in., stroke 18 in.

The Nos. 4 and 5 are Mining Pumps.

We have also for sale a full assortment of Pump Fixtures, such as Iron Pipe, Hose, Brass Goods, etc.

J. W. BRITTAN & CO.,
12v12 3m 120 Front street,

Hepburn & Peterson's
AMALGAMATOR.

THE SUBSCRIBERS WOULD CALL THE ATTENTION of the Mining Public to their Reducer and Amalgamator, and also to their Separator for reducing and separating the mineral from

Gold and Silver Ores,

Manufactured and exhibited at the Vulcan Iron Works, Nos 137 and 139 First street, San Francisco.

These machines secure to the Miner a more Expeditious and Perfect Reduction and Amalgamation, a less liability to accident and delay, and a greater amount of useful effect in proportion to the power employed to keep them in operation than any other machine now in use for producing similar results. This fact is attested to by their general adoption and preference at all the principal Reduction Works in Nevada; among which may be mentioned the Gould & Curry Mill, the Silver State Reduction Works, Zephyr Flat Mill, Pioneer Mill, Eastern Slope Mill, Phœnix Mill, etc.

☞ This Amalgamator may be seen in operation at the European Metallurgical Works, Bryant St. bet. 3d and 4th. [Illustrated in the Mining and Scientific Press, April 9th, 1864.]

HEPBURN & PETERSON.
nov8 3m*

HUNTER'S
PREMIUM
CONCENTRATOR, AMALGAMATOR
AND SEPARATOR,

Awarded a Silver Medal at the late Mechanics' Fair.

HUNTER'S CONCENTRATOR CAN BE SEEN IN OPERation daily at the Novelty Iron Works, Fremont street. Parties wishing to purchase Concentrators will find it to their advantage to examine the above machine before purchasing elsewhere, for the following reasons:

1st. It will work the sands from a 5-stamp battery, and save from 10 to 20 per cent. more sulphurets than any machine built on the Pacific coast.

2d. The Sulphurets are washed clean, containing less than ten per cent. of sand.

3d. The waste free gold and amalgam is amalgamated on the copper plates; not one of ground mercury and scarcely a trace of metal passes off with the sand.

4th. Its simplicity is a sufficient recommendation for its general use as a Concentrator. The variation of speed in a Quartz Mill does not effect the working of the Machine. The same was demonstrated at the late Mechanics' Fair, when with the greatest irregularity of speed the best of results were given.

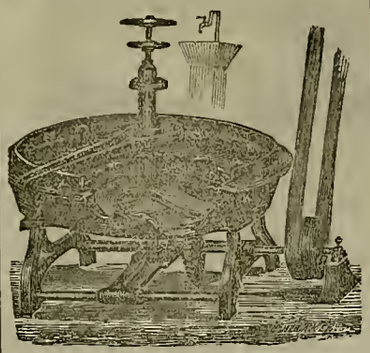
5th. There is no clogging or stopping to clean out the sulphurets and sand; consequently no waste from any inattention on the part of the attendant.

6th. In exhibiting the working of the machine (it is not run empty), all classes of ores and tailings, from 50 pounds and upwards, are concentrated that parties may see fit to test the machine with.

Give it a trial, and satisfaction is guaranteed. All orders and any information required, address,

ANDREW HUNTER,
Novelty Iron Works, Fremont st., San Francisco,
15v11-3m Or to E. T. STEEN, Agent.

BAUX & GUIOD'S
Separator & Amalgamator



Is the most important improvement in mining machinery ever introduced. It was awarded the FIRST PREMIUM at the San Francisco Mechanics' Fair for 1861, where it proved itself to be the best Separator and Amalgamator among all the competitors. Constructed on principles which combine SCIENTIFIC KNOWLEDGE WITH PRACTICAL EXPERIENCE, these Pans extract more gold and silver from their ores than any others in use, as a few hours trial will demonstrate. Mill men will find it to their advantage to employ these pans as Separators, in addition to the ordinary Amalgators now in use, and to rework their old tailings.

The cost of these pans is inconsiderable, and their structure is such that they can be readily separated in parts convenient for packing on mules. Among the many advantages possessed by BAUX & GUIOD'S Pan, are the following: The trifling cost for attendance; Its small cost; Its portability; The large quantity of pulp it can operate upon in a given time; It may be worked even weeks without stopping, as it is constructed to work continuously; The complete thoroughness of the separation of the rock from the metals and the trifling power required to work them; They can be attached to any ordinary crushing apparatus.

We have the pleasure of referring parties interested to the following parties, who have our Pan in use: Jefferson Mining Company, Bowman's Ranch, Nevada county; The French Mill, Nevada City; Crail's Gravel Cement Works, Nevada county; Waltman's Chlorination Works, Nevada, Cal.; Gold Hill Quartz Mill, Washoe.

Manufactured at the Vulcan Iron Works and San Francisco Foundry, San Francisco, and at Heugh & Thom's Foundry, Nevada City.

For further particulars, or to see this Pan in operation, call on or address

J. B. BAUX,
Fremont Street, near Mission, adjoining the San Francisco Iron Works, San Francisco. 4v8-6df

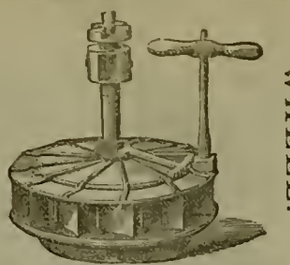
LEFFEL'S
American Double Turbine



WATER WHEEL.

THIS WHEEL, WHICH HAS HAD THE most unprecedented sale of any water-wheel ever made, and which has given unusual satisfaction wherever used, is now for sale by KNAPP & GRANT, 310 Washington street, San Francisco, where persons desiring to use water-power can be supplied. These Wheels are adapted to use from 10 to 5,000 inches of water, and from 4 feet to 500 feet fall. Let us know how much water you have either in miner's inches or cubic feet per minute, what fall you have, and what power you require. Write or send for circular to

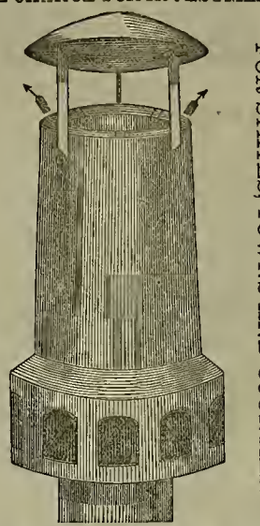
KNAPP & GRANT,
—ALSO—
San Francisco.

Leffel's Lever Jacks.

For railroads, cars, or wagons; Railroad Jacks for engines and cars; Truck Jacks for leveling, with which three men, with a pair of these Jacks, can level more track in a day than twelve men working in the ordinary manner; also, Truck Jacks for relieving the axle of pressure to replace the brass. These Jacks are now in general use in the Eastern States, and give entire satisfaction. Also, Wagon and Truck Jacks of the most superior make and kind. For sale by

KNAPP & GRANT,
12v12 3m San Francisco.

A RARE CHANCE FOR INVESTMENT.



THE PATENT RIGHT FOR SALE FOR STATES, TOWNS AND COUNTIES.

For the Best Chimney Top

Ever invented. Numerous testimonials from Proprietors of Factories, Foundries, Steamers, Hotels, etc., can be shown, attesting to its usefulness in creating draft, saving the expense of high chimneys, and a great saving of fuel. Pamphlets containing descriptive drawings and testimonials will be sent free, upon application by letter or otherwise to the patentee,

4v10

VARNEY'S
PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the

PACIFIC FOUNDRY,
1v1 San Francisco.

Prater's Patent Concentrator

(Known as HUNGERFORD & PRATER'S Concentrator,)

MANUFACTURED AT THE

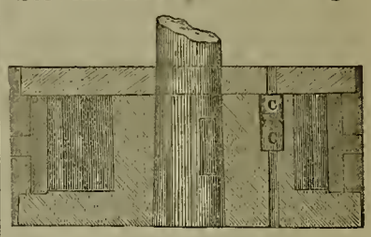
San Francisco Foundry and Steam Engine Works.

Corner Fremont and Mission Streets.

All orders promptly attended to.

2v12 DEVOE, DINSMORE & CO.

Stevens' Pressure Packing.



Patented March 7th, 1865.

Pressure Packing is now conceded, by the best engineers, to be the most effectual method of making and keeping the metallic ring of pistons steam-tight.

STEVENS' PACKING has the advantage of being cheaper in first cost than the ordinary packing, and can be applied to old style pistons with very little alteration or detention. In place of testimonials, the Patentee requests of those who are using the old spring packing to inquire of the owners of the various engines which now have this packing in quicksilver, some of which have been running from three to twelve months without being opened, or showing any descriptive leak—and act upon their recommendation.

Further particulars can be had by applying to the Patentee, ANDREW STEVENS, Master Mechanic, Alameda Railroad, or at the VULCAN IRON WORKS, where they can be seen, at any time, in course of construction.

10df ANDREW STEVENS.

Portable Steam Engines!

"Hoadley's" and "Hittinger's" Make,

COMBINING THE MAXIMUM OF EFFICIENCY, Durability, and Economy, with the Minimum of weight and Price.

These Engines are favorably known, a large number being in use on this coast for hoisting, pumping, threshing, milling and mining purposes.

Steam can be got up on these Engines in fifteen minutes after reaching the place of operation, and the time, expense of setting boilers, machinery, and "construction account" saved, (which is often the difference between the successful and unsuccessful prosecution of milling enterprises,) in fact, the portable principle is the pioneer's friend, and enables him to draw engines on their own wheels to his cabin door, and plant on the outermost confines of civilization the saw and grist mill, and it has done and will do more to help subdue the continent than any other of the modern motors which are crowding society and normalizing the world.

All sizes on hand from 3 to 30 horse power, with and without carriages.

Also, Portable Saw and Grist Mills.

For sale by TREADWELL & CO.,
3v12-3m Corner of Front and Market streets.

PETROLEUM STOVES.

A MOST USEFUL INVENTION FOR ALL manner of COOKING and for IRONING, without any litter, as ashes or soot. Cheap and convenient, and peculiarly suited to the wants of this community.

Smoking by them is divested of its disagreeableness, and becomes a pastime, as many can testify, who have used them in this city. To be seen at

316 Montgomery street,

Where they are for sale by

BULLARD & BATTLES,
Proprietors for California.
San Francisco, March 3d, 1866. 10-v12

12v12-tf Patentee.

BY EXPRESS.—Two cents per copy will be added to our usual rates of subscription (to pay Wells, Fargo & Co.'s tariff) on papers sent by express. If connecting expresses in the interior make additional charges, subscribers must themselves settle the same.

The cattle plague which is working such terrible destruction in Europe, is probably the same which has afflicted the world, at intervals, from the earliest periods of civilization. It is, no doubt, the same as that to which Virgil refers, when he wrote—

* * * whose herds to death it sweeps,
High in the stalls it piles the loathsome heaps.

It visited England about the middle of the last century, at which time it continued its ravages twelve years. It subsequently visited Holland, where it continued for eighteen years. No human agency has yet availed to stop its career; it continues until it apparently dies out by natural causes.

Petroleum in Europe.—Reports of discoveries of oil springs in various parts of Europe are being given in the English papers. Those papers predict that the discoveries are such as to warrant the conclusion that they will soon be able to obtain a full supply for all demands without having to resort to America. It is possible that these accounts are exaggerated, although they appear to be received with much credence by the Eastern press.

The Hopeful Builder.—A swallow, in the Spring, came to our granary, and 'neath the eaves essayed to make a nest, and there did bring wet earth and straw and leaves. Day after day she toiled with patient heart; but ere her work was done, some sad mishap the tiny fabric spoiled, and dashed it to the ground. She found the ruin wrought, but not cast down, forth from the place she flew; and with her mate fresh earth and grasses brought, and built her nest anew. But scarcely had she placed the last soft feather on its ample floor, when wicked hands, or chance, again laid waste the ruin o'er. But still her heart she kept, and toiled again; and last night, hearing calls, I looked, and lo! three little swallows slept within the earth-made walls. What truth is here, O man! hath hope been smitten in its early dawn, hath cloud o'ercast thy purpose, trust or plan, have faith, and struggle on!

Labor and Recreation.—Recreation is intended to the mind as whetting is to the scythe, to sharpen the edge of it, which would otherwise grow dull and blunt. He, therefore, that spends his whole time in recreation, is ever whetting, never mowing; his grass may grow, and steed starve; as contrarily he that always toils and never recreates, is ever mowing, never whetting—laboring much to little purpose. As good no scythe as no edge. Then only doth the work grow forward when the scythe is so seasonably and moderately whetted that it may cut, and so cut that it may have the help of sharpening.—*Bishop Hall.*

Important Educational Movement.—The San Jose *Patriot* says that the Methodists of this State are engaged in one of the most extensive educational enterprises of the day. They have purchased a large tract of land on the Stockton ranch, about midway between Santa Clara and San Jose, on the Guadalupe river. The ground is to be twenty acres upon which the University buildings are to be erected. The balance of the land is to be laid out in lots and sold.

Figs grow directly from the bark of the tree and are not developed from flowers, as is the case with most other fruits.

OUR NEW YORK AGENCY.

Mr. Geo. M Newton is our authorized agent in New York City, and will receive advertisements and subscriptions for the Mining and Scientific Press at regular rates. NOTICE TO QUARTZ MINERS.

Hendy's Improved Patent Self-Discharging Sulphurets

PRATER CONCENTRATOR
Is Receiving Universal Favor.

Reference is made to the following Mills which are using the Prater Concentrator, with some of the improvements attached. The Self-Discharging Sulphurets has been more recently adapted, and the public attention is called to examine its workings:

STEPHENS' MILL, Humboldt County, Nevada.
CHRYSOPOLIS MILL, " "
U. S. REESE RIVER MILL, Austin, "
CARROL & ASPINWALL MILL, Reese River, Nevada.
UNION MILL, El Dorado County, near Mud Springs.
NEW YORK AND EL DORADO CO., "
BLUE LEDGE MILL, near Spanish Flat, El Dorado Co.
CONEY MILL, Jackson, Amador County.
Messrs. TUBBS & CO'S MILL, San Andreas, Amador Co.
WINTER'S MILL, Angels Camp, Calaveras County.
CLIO MILL, Jacksonville, Tuolumne County.

And in use in other parts of this State; also in Idaho, Arizona, Colorado and Mexico.

As a further evidence of its worth, orders have been received recently from the proprietors of the following mills, all of whom are using these Concentrators, or have works in the immediate neighborhood of mills using them, viz.:
One Concentrator ordered for the Coney Mill, Jackson, Amador County, by Messrs. Bigelow & Bro., of this city.
Three Concentrators for the Spring Hill Mill, Volcano, Amador County.
Two Concentrators for the Golden Gate Mill, Volcano, Amador County.
Four Concentrators for the Raw Hide Ranch Mill, Sonora, Tuolumne County.

They may be seen in operation at the GOLDEN STATE FOUNDRY, No. 19 First Street, San Francisco.
☞ For explanation of the above engraving, and other particulars, send for a Circular.

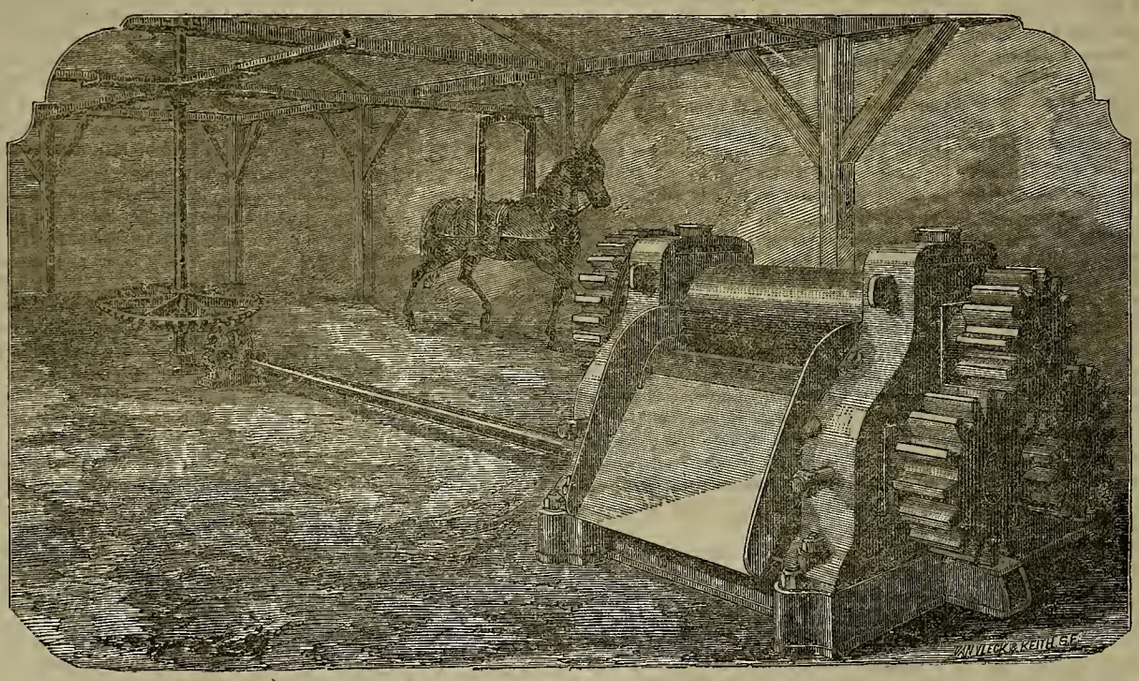
SUGAR ON THE PACIFIC COAST.

The Sandwich Islands are destined to serve the same purpose to the western coast of North America that the West India Islands have so long done to the eastern portion of this Continent and to Europe—they are to become the great source from whence we are to receive our supply of sugar and tropical fruits. The sugar cane is indigenous to those Islands, and can be cultivated there to its highest degree of perfection. Upon this group there are already about thirty-three sugar plantations, the first of which was commenced about the year 1847; but was not considered a successful enterprise until some four years after. Since 1855 the sugar interests there have continued steadily to increase, until the present time. The exports of sugar last year reached the large amount of 15,000,000 pounds. A very large quantity of molasses was also exported.



This group of Islands consists of thirteen in number, five of which are, however, mere islets; the other eight are inhabited, containing a population of about 75,000 souls, with an area of nearly 7,000 square miles. Hawaii is the largest and most eastern of the group, and contains more superficial territory than the entire State of Connecticut.

The Islands are mountainous, with beautiful slopes, and contain numerous fertile valleys. They are situated almost directly in the track of several very important sea routes; besides being themselves the principal depots for the Pacific whaling fleet. They are almost in a direct line between this city and Japan and China.

The capital, and principal port of the group, is Honolulu, which is situated on the island of Oahu. A steam propellor is kept constantly running between the capital and the other islands of the group. The produce of all the islands is collected at Honolulu, from whence all exports are made. A large fleet of inter-island schooners is employed in this business.

The number of sugar plantations has doubled within the past three years. The Government of the Islands is modeled very much after that of Great Britain.

Several of the larger plantations yield annually from 700 to 800 tons of sugar. Native labor is chiefly employed; although recently numbers of coolies have been imported. These coolies are landed there at a contract cost of $80 each, and bound for five years at a monthly rate of wages of from $4 to $5, and found.

The principal thing now needed to develop the resources of these islands is capital; the requirements for which are very large in plantation business. All the sugars now raised there are consumed on this coast, and yet the supply from that source is but a little over one-third of the demand for this port. There is no reason why the business there may not be indefinitely increased, even beyond the immediate demand here, by seeking foreign markets.

The city of San Francisco has an important interest in the building up of the sugar business at the Sandwich Islands, from the fact that such an industry will call for a large amount of machinery, which must be furnished from this city. Steam engines, boilers, sugar rolls, evaporating pans, water and horse powers, gearing, shafting, conducting pipes, etc., will be wanted, just in proportion to the extent of the business. Numerous orders for this kind of machinery have already been filled; and the demand therefor is rapidly increasing. The first machinery introduced at the Islands was obtained from England. Experience, however, has proven that it can be now economically purchased in San Francisco.

The proprietors of the Miners' Foundry have taken much pains to procure the latest and most approved drawings and specifications for this class of machinery, and are now prepared to execute orders for any kind which may be required either in the production of the raw material, or for refining purposes.

In the annexed engraving we give a representation of a set of sugar rolls, to be driven by horse power, or which may be readily adjusted for steam or water. This apparatus consists of three heavy iron rollers, keyed on heavy wrought iron shafts, working in properly constructed bearings, fitted into massive cast iron head stocks, the whole firmly bolted to a heavy iron bed plate, which also forms the pan into which the cane juice is received, from the first operation to which it is subjected.

The machinery required in the manufacture and refining of sugar is among the most expensive and complicated of any which enters into the range of industrial pursuits; and the establishment of a heavy interest of this kind on the Pacific Coast, supported by the raw material drawn from the neighboring islands, cannot fail to add largely to the extent of the mechanical interest of San Francisco.

The quality of Hawaiian raw sugars averages very high, and it is gratifying to remark the satisfactory results which have generally attended the sugar interests of the Islands during the past year. It is also a matter of congratulation and a most significant fact, that Hawaiian sugars have reached the highest *value* on our list of imports, although the quantity imported is exceeded by that from Manila.

From official returns at our Custom House, we gather the following summary of weight and value of Sugars imported into San Francisco during the year 1865, receipts of which were divided as follows:

Hawaiian Islands	lbs 13,554,505	$862,617
Manila	14,468,140	545,835
Peru	3,329,101	202,242
China	2,276,160	112,581
All other places	1,330,487	57,520
Total	lbs 34,958,402	$1,780,795

THE CALIFORNIA BUILDING AND LOAN SOCIETY.—This institution, which was first inaugurated some five years since, under the chief management of Mr. Thomas Mooney, its present president, has recently greatly enlarged its sphere of usefulness, and is now a joint stock company with 400 partners, managed by nine directors, with a paid up capital of $250,000. The society has purchased and fitted up a very fine building for a banking house, on California street, next door above Sansome. The principal object of this institution is to assist industrious persons to erect dwellings for homesteads, etc.; and to extend the facilities of bank accommodation in a more liberal manner than has hitherto been done in this city. Hundreds of families, it is said, have already possessed themselves of comfortable homesteads through its aid. The new building was inaugurated a few days since, on which occasion a large number of our substantial moneyed men were present, several of whom addressed the meeting. Mr. Mooney read the new propositions of the Directors (which will be found in our advertising columns), and commented upon each article. He said that the credit hitherto afforded by the banks of California, was totally inadequate to the wants of the commercial and industrial classes of the people. What merchant or manufacturer could start any enterprise on a thirty days' credit and the apprehension of steamer day? They had the finest country that the sun shone upon, yielding the finest white wheat, finest wool, finest vegetables, finest wines, and the earth plethoric with gold, silver, quicksilver and other metals, and yet thousands of persons were out of employment, and crying aloud for work. This, he thought, arose from the want of liberal banking and longer credits. The Building and Loan Society had resolved on extending accommodation to manufacturers, shipping and general trade, not for thirty days, but for thirty weeks. His remarks were received with hearty cheers.

C. E. GEDDES, architect, No. 315 Montgomery street, between Pine and California, room 14 (up stairs), can be consulted at all times in reference to plans, estimates, specifications and detail drawings, for all kinds of buildings. Any work above described submitted to him, will be attended to with accuracy and dispatch.

CURE FOR RHEUMATISM.—Those suffering from rheumatic complaints should go for relief where experience has proved the efficacy of the remedies administered. Dr. Johnson has had remarkable success in rheumatic operations. The case of Daniel Somerset is a notable proof of his skill. His office is No. 700 Market street.—*California Leader.*

Sodium Amalgamation.

WHY DOES SODIUM ASSIST THE AMALGAMATION OF METALS?

Sometime since, and before I had heard of the use of sodium as an assistant in amalgamating metals, I prepared the result of the following experiment for publication. Circumstances delayed it, but I now give it to the interested for what it is worth. Having given my views to several practical men in this city, they tell me that the theory explains many things which they have met in their experience that were incomprehensible to them, and they have urged me to make it public.

THE EXPERIMENT.

Take a clean tumbler and fill it about two-thirds full of clear water; then drop a little finely pulverized metallic powder upon the water. Gold dust or bronze, (such as printers use, and nearly every printer has it,) or silver powder will answer, provided it be sufficiently fine. Then stir it smartly with the handle of a spoon or the blade of a knife. It will be seen that the powder will not sink in the water; but, on the contrary, the more it is stirred the more obstinately it keeps at the top. When you have sufficiently demonstrated to your own satisfaction the almost impossibility of sinking the metal, which, being heavier than the water, by the laws of gravity should sink, drop into the tumbler a little caustic potash or soda, and stir a little, the powder will then be seen to leave the top, and in a short time settle at the bottom of the water.

THE CAUSE OF THE METAL FLOATING.

Atmospheric air adheres with great tenacity to any highly polished surface, and is very difficult to displace. It preserves a knife-blade by preventing the moisture from getting to it to oxidize it. Dip a knife-blade or a razor into water, and drawing it out you will find that it has not been wet—a film of air interposed between it and the water. So with each particle of dust which you placed on the water in the tumber. Notwithstanding its being so exceedingly fine, it is surrounded with a layer of atmospheric air as thick as that on the surface of a knife-blade. The particle being round and smooth, no mechanical means which you can use will displace the air so that the water can get to it, and the air being lighter than water, acts as a balloon to sustain the piece of metal. If you agitate it in the water with a spoon, or force it down by any other means, the air will still stick to its piece of metal, and as soon as you let it alone, it will rise to the surface. How it is that the alkali makes the air let go of its hold on the metal, I do not know. The experiment shows that it does do so, and the metal sinks.

APPLICATION OF THIS TREATMENT TO AMALGAMATING THE IMPALPABLE GOLD DUST IN QUARTZ ROCK, AND ITS THEORY.

Suppose every particle of gold dust in quartz rock to be as fine as the dust with which this experiment is made (and much of it is finer), very little of it would have its film of air displaced by the mechanical operation of crushing, although on account of much of it clinging to the particles of quartz it would not float; part of it would sink to the bottom, part would remain floating between the bottom and the surface of the water, the film of air and the quartz dust fighting for the mastery, the air trying to take it to the top, and the quartz dust trying to pull it down. As long as the particle of gold or silver remains covered with the air, the mercury cannot come in contact with it any more than can the water. The mercury to take it up must come in contact with the naked gold, and not with the gold protected by a mantle of atmospheric air. Therefore, in order to the effectual amalgamating of gold or silver dust from quartz rock, some means must be used to disperse the air surrounding the particles of dust. Heat will do this partially, but caustic potash or soda will do it effectually. It also acts as a deoxydizing agent—that is if the oxyde of some base metal should be in contact with the gold, it will remove it or clean the gold, and it will keep the mercury clean.

About one pound of caustic potash or soda will remove the air from metal that is immersed in five gallons of water. Does not this explain the cause of the advantage derived from the use of sodium? If this is the true theory, whence the necessity of using the expensive metal itself? It cannot be denied that the sodium is oxydized and becomes soda, and is dissolved in the water in the pan. When that takes place, and not until then, does the sodium produce the beneficial results.

I am aware that alkalies have been used in amalgamating pans with partial success. But have they been used intelligently? Common potash or soda of commerce in the best state in which you can buy it, is composed of forty or fifty per cent. of carbonate. In transporting it to the mines, and from exposure to the air when opened, a much larger percentage is turned into carbonate, and in that state is of little use to disperse the atmospheric air. To be effectual for this purpose, it must be as nearly caustic as possible.

In regard to the electrical effect resulting from the use of alkalies in the amalgamating pans, my experience proves that it cannot be otherwise than highly beneficial. Zinc, lead, and antimony would be taken up in large quantities by a caustic alkaline solution, when contained in an iron vessel. I have used, and for some purposes prefer to all others, especially for precipitating the reguline copper, a battery composed of iron and zinc in a solution of caustic potash. WM. HILMER.

Influx of Water into Mines.

BY PROFESSOR ROWLANDSON, F. G. S. L.

A recent number (10th February last) of the London *Mining Journal*, contains a brief but most interesting letter from Mr. Charles Bawden, an able Cornish mining engineer, relative to the above caption. In the course of the letter, Mr. Bawden shows by actual gauging, that the water discharged through the "Gwennap Main Adit" only amounted to one-half of the quantity pumped from the lower levels to the adit, from which the inference is positive that one-half the water drawn from below, in its passage along the adit again percolates into the mine, thus causing a double charge for pumping. This is one of many instances that could be adduced, where an immense outlay is occasioned in mining from non-attention to what is oftentimes mistakenly considered a very trivial cause.

Few persons, perhaps, would be particularly struck with the above fact, from causes not now necessary to explain; the writer of this article was more than twenty years ago induced to believe that the fact was pretty nearly as stated by Mr. Bawden, and about that time he so informed the managers of the great mines in the Gwennap district, as also those interested in the great workings of the contiguous districts of Cambourne, Gwinear, etc., and was laughed at by every self-styled practical mining captain—the cost so occasioned being classed by these *practical* men as too contemptible to be noticed.

I believe it was at the last meeting of the British Association, that another gentleman demonstrated that fully one-third more water was raised from the coal mines in the district of the ten yard coal in Staffordshire, than the entire rainfall, which would be equivalent to the proportion found to be raised in excess at Gwennap, as returning to the mines after being raised to the surface. To remedy the evil, Mr. Bawden recommends that the water raised to the surface should be conveyed through secure tubes or channels until discharged from the mouth of the adit. I would, however, suggest that when practicable a step in addition should be adopted, namely, that where the nature of the ground permits, such water-tight channels or tubes should be prolonged on the hillside to a point below the level of the water in the mine before the latter is permitted to run free. On this coast where pumping is so costly, such precautions are doubly valuable.

The gold bearing quartz in the vicinity of the Great Falls of the Potomac, about fourteen miles from Washington City, is beginning to attract considerable attention.

No change has been made in the form of the plow used in Sicily since the times of the Romans.

[Written for the Mining and Scientific Press.]

Mining About Greenwood, El Dorado County.

EDITORS PRESS:—Having a few spare minutes, I thought I would give you an idea of the mining prospects of the neighborhood, around Greenwood. I never saw better looking lodes (for gold) in any place in the country, than are to be seen here, and I am greatly surprised that so little effort has been made to develop them.

One ledge especially, which I recently visited, I found with a hole sunk upon it on the "foot-wall," twenty feet deep and twenty-five feet long, being in fact an open cutting. Out of this cutting there has been $1,000 taken; yet, owing to the ground being a little soft and timber required, this apparently very valuable mine is not worked. The croppings are from eight to ten feet thick, and can be traced at intervals for miles, and much free gold can be seen throughout this whole extent. I obtained two bits to the pan from some of the fine quartz. I gave my opinion of its merits to the owners of this mine, and explained how they might work it to advantage. Since my visit, I have been informed that in a few days they will commence to sink a new shaft, nine feet long by five feet wide, and I have no doubt that in a very short time a valuable mine will be the result; of which I will duly post you, so that this much-neglected place may have that attention paid to it which it deserves.

It is true that Grass Valley is famous for its quartz mines; of that fact I am fully aware, as I have spent several years there; but I know, also, that there are equally good prospects here. All that is wanted here is capital, when as good mines as California can produce will be found.

Now, gentlemen, you say in the city of San Francisco, "All aboard for Grass Valley!" I would say to you, "get on board for Greenwood," and examine for yourself, when I am satisfied your judgment will at once corroborate my statements, and you will be enabled thereby to tell of the hidden treasures of this district. I will at times keep you posted with regard to the mining prospects of this place.

In conclusion I would say, that the chief reason why more quartz ledges are not worked here, is owing to the fact that the miners are mostly engaged in placer mining, and the further reason that they are comparatively poor and unacquainted with quartz, or any other mining below the surface.

R. POWNING.

Greenwood, April 9, 1866.

NEW MINING ENTERPRISE.—A new mining enterprise of no mean magnitude has been inaugurated in our county, says the Monterey *Gazette*. Milpitas ranch, near the Mission San Antonio, in the southern extremes of this county, is to be worked by the Ning Yung Company, who have bought it. It has long been known that there were extensive fields of gold-bearing placers in that section, and during the wet season of every year parties have successfully operated, although on the smallest scale, making three dollars per day, after picking dirt for some distance and panning or rocking it out.

THE MEMORY OF A MOTHER.—When temptation appears, and we are almost persuaded to do wrong, how often a mother's word of warning will call to mind vows that are rarely broken. Yes, the memory of a mother has saved many a poor wretch from going astray. Tall grass may be growing over the hallowed spot where all her earthly remains repose; the dying leaves of autumn may be whirled over it, or the white mantle of winter may cover it from sight; yet the spirit of her, when he walks in the right path, appears, and gently, softly, mournfully calls to him when wandering off into the ways of error.

NEW ORLEANS now has a population larger by 60,000 than ever before; Galveston and other Texan cities are full to overflowing; and the same is said of Memphis, Mobile, Montgomery, Atlanta, and all the towns of the Southwest.

THE eternity of the Union of the States consists, essentially, in the fact of their indestructibility. A star may dim, but not one shall ever leave the constellation.

THE increase of children in Iowa, between the ages of five and twenty-one years, during the year 1865, was 28,411.

[Written for the Mining and Scientific Press.]

Reese River Correspondence.

EDITORS PRESS:—In your issue of March 31st, I observe a letter from Mono county, California, entitled "The Cause of Failure in Mining Enterprises," in which the incapability of mining superintendents is touched upon in no very mild manner, and being of like opinion with your correspondent, with your permission, would extenuate upon the present "mode" of conducting mining enterprises, particularly as they have come under my observation in this Reese River section, with the hope that they may prove worthy of your consideration. I should judge your correspondent to be one of much practical experience in mining; at all events, his observations of the manner of the proceeding in mining by inexperienced men are correct. He is also perfectly correct in saying that the slow progress of development of our mining interests is the result of inexperienced men being placed at their head. He also says that we of Reese River can, to our sorrow, vouch for the correctness of his remark. To my regret, I must say we can.

Reese River is at present in a worse condition, in respect to development of mines, than it was three years since. Originally the mines were held and owned by the discoverers—men who immigrated here in the early days of the country, whose only hope of success was in the development of their respective mines, which development was prosecuted with all the energy their limited means would admit of. Through accident, as it were, some Eastern capitalists were induced to interest themselves in our midst merely as a venture. And from that time to the present, with all the capital that has been expended, we have been pretty much at a stand still, all original owners only wishing to sell, leaving the unfinished work of development to the purchasers. But Eastern capitalists have interested themselves by degrees to such an extent that they are the virtual owners and possessors of the whole section; and to them alone in the future must we look for succor and the development of our mineral wealth.

The real blame for the slow progress of the development of our mines is not wholly due to the superintendents. They, as a general thing, being pretty good fellows, always ready to turn an "honest dollar," by accepting from their patrons a position at a good salary, the requirements of which position they are entirely ignorant. They are satisfied in their positions and their salaries; and if their employers do not meet with satisfactory returns, it is the company that is at fault in the choice of managers, and not the mistakes the superintendents make through ignorance or inexperience.

The proper course to pursue would be for capitalists to engage practical men, experienced in mining, to conduct such companies. Men who have become miners through the use of mining implements; who have delved and worked day after day in search of the "hidden treasure," who can tell when the day is passed whether the laborer is worthy of his hire, and who have personal knowledge whether the work of the day has been properly executed.

Eastern mining speculators have a mania for mills, and have gratified their taste here to such an extent, that there is at the present time in this county of Lander, at the lowest figure, at actual cost of purchase and erection, two million dollars of mill property lying idle; while those in constant and occasional milling do not consume over thirty-five tons of ore *per diem*. To cap the climax, there is no prospect of a change for the better under the present management. Some companies have expended all their working capital on their mills, and, consequently, have no means with which to prospect; others having money are prospecting after their own ideas of mining, and generally with but little if any judgment or success.

Those interested in mill property are unwilling to invest even in fuel or timber to any extent, even at good bargains; their excuse being they want ore first.

It is a lamentable fact that we are at a "stand-still," poised as it were upon a pivot. Our success or ultimate destruction depends alone upon the action of the possessors and owners of our mineral lands, upon the proper course of working, by placing at the head of the enterprises men of experience and judg-

ment; our destruction and slow depreciation, as a mineral region, in the continuance of inexperienced men experimenting. By the present mode of proceeding we shall continue to sink and depreciate until we shall be led to believe, even against our will and the knowledge of the vast richness of this section, that we are a total wreck, and that mineral is not and never was found here.

This state of affairs is truly provoking, and particularly to those conversant with the present state of mining matters. Superintendents themselves acknowledge the true state of affairs, but they argue very sensibly for their interest that their salary is as good and better to them than to another.

Some few mines under the supervision of "miners" of long experience, and who can and do take hold themselves, are doing well, and the work done thereon is a credit to those in charge. Although I am not pecuniarly interested myself, and not requested so to do, I mention one or two instances wherein there have been good results shown through a proper course of working.

The Savage company, situated on Lander Hill, under the supervision of W. O. Hubbard, is a producing mine, and is supplying the California mill with a sufficiency of ore for her capacity (10 stamps), and of a very superior quality. Through energy and judgment alone has this result been attained. This mine ships fully half the bullion leaving Reese River at present.

The Metacum mine is another instance of the fruit of experience and judgment in mining. This mine is situated about four miles northerly from this city, and contains 800 feet; and under the superintendence of an experienced miner of long standing, Mr. John Howell, it shows a system in working and a thorough development of the mine second to none as yet shown in this district. The ledge is cut by a tunnel at a depth of 124 feet from the surface, from which point of tunnel there has been a shaft raised to the surface, showing a ledge without a flaw the whole depth of from eighteen inches to two and a half feet in thickness. From said point or terminus of tunnel there has been a level run, both northerly and southerly, over 150 feet, uncovering the ledge, and at no point in said level is the ledge at fault; thereby laying open over 300 feet in length by 124 feet in depth of ledge, and ready for the mill. This body of ore will average, per mill working, at a safe estimate, $125 per ton. Work is still being prosecuted both in the levels and in sinking perpendicularly on the vein, the ledge increasing in width and richness as depth is attained; and further, not until there was money sufficient (in ore) found was there a mill contracted for. The company have a mill upon the ground, and now in course of erection, and by the 1st of August it will be hammering away on the known product of their own mine, and will be founded, as many others here are not, on a solid foundation. Others I could name, and many a competent man to fill the places with success, now occupied by those incompetent to fill them, either to the advantage of their employers, or to their own credit as managers. And I will further say without reserve, that until alteration is made, we shall continue to "drag," as we have—to use a homely expression—the "cart being before the horse."

PROGRESS.

Austin, April 7, 1866.

COPPER DISCOVERY.—The Nevada *Gazette* says that great excitement is raging in Little York township, caused by the discovery of a copper ledge, believed to be immensely rich. This ledge was discovered several months ago by John Thorp, who resides at Hermitage Ranch, while hunting on the other side of Greenhorn. He made a location, and has sunk a shaft some ten feet in depth upon the ledge, finding copper ore of extraordinary richness. The ledge has been traced from Thorp's location in a southerly direction to Bear river, and northerly to Deer Mountain, within three miles of Nevada, a distance of five or six miles. Numerous extensions have been located, and the country between Greenhorn and Bear River is full of prospectors. Specimens taken from Thorp's shaft look exceedingly well, containing much black oxide of copper and peacock ore. An assay of ore, made a few days ago, yielded thirty seven per cent. of copper; but this was probably a choice specimen. This is the most promising copper prospect that has yet been discovered in the county, and the indications are that the ledge will prove valuable. Many of the locators think they have a fortune secure, and some of them have heretofore been interested in copper prospecting, and are not likely to be easily excited.

MORE than one million of Webster's spelling books have been sold to the South since last April, and the demand is so much greater than the supply that the publishers have sent to England to get it printed.

Hardening and Tempering Steel.

When steel is heated to a cherry-red color, and then plunged into cold water, it becomes so extremely hard and brittle as to be unfit for almost any practical purpose. To reduce it from its extreme hardness is called by the workmen *tempering*, and is effected by again heating the steel to a certain point. The surface being a little brightened, exhibits, when heated, various colors, depending upon the formation of thin films of oxide*, which constantly change as the temperature is increased, and by these colors it has been customary to judge of the temper of the steel. But a more accurate, as well as convenient method, is to use a bath and thermometer; the bath may be of mercury, or of the fusible mixture of lead, tin, and bismuth, or, indeed, of any fluid whose boiling-point is not much under 600°. Into this bath the articles to be tempered are put together with the bulb of a thermometer graduated to the boiling point of mercury. The corresponding *degrees* at which the various colors appear are from 430° to 600°. The first change is at about 430°, but this is too faint to be distinguished, except by comparison with another piece of untempered polished steel. At 460° the color is *straw*, becoming deeper as the temperature is increased; at 500° the color is *brown*; this is followed by a *red* tinge with streaks of *purple*, then *purple*, and at nearly 600° it is *blue*. The *degrees* at which the respective colors are produced being thus known, it follows that the workman has only to heat the bath, with its contents, up to the required point. For example, suppose the blade of a penknife (or one hundred of them) to require tempering: they are suffered to remain in the bath until the mercury in the thermometer rises to 460°, and no longer, that being the heat at which the knife (supposing it to be made of the best English cast-steel) will be sufficiently tempered. The advantages attending this method are obvious; the heat is equally applied to the whole; and the workman, instead of attending to the color of each blade, has only to observe the thermometer.

It has been found that steel, for certain uses, is sufficiently tempered long before it is heated to produce any change of color, a circumstance which gives additional value to the process by a thermometer. The knife-edges attached to a pendulum described by Capt. Kater, (*Phil. Trans.*, 1818, p. 38,) were forged by Mr. Stodart from a piece of fine wootz [a variety known as Indian steel, usually containing a small percentage of tungsten, and from which the famous Damascus sword blades were supposed to be made]. They were carefully hundred, and tempered in the bath at 430°; on trial they were found too soft. They were a second time hardened, and then heated to 212°. The intention was to increase the heat from that point, trying the temper at the advance of about every ten degrees. In the present instance this was not necessary, the heat of boiling water proving to be the exact point at which the knife-edges were admirably tempered. It is highly probable that steel, for many uses, may be sufficiently tempered in a range so extensive as from 212° to 430°, and, by the thermometer, all the intervening degrees may be certainly ascertained. But it is not the temperature only, but also the time during which the steel is exposed to it, which influences its hardness or temper.

What may be the changes effected in the molecular constitution of steel by the operation of hardening is an important, but a very difficult and undecided question; that they are considerable, there can be no doubt, but that they extend beyond mechanical arrangement, and affect chemical composition, according to the notions of Karsten, is a theory which requires much more satisfactory proof than it has hitherto received; nor are the changes which other substances undergo by a similar operation in any way illustrative of or applicable to those of steel, the electro-magnetic properties of which are not less remarkable than the coarser mechanical changes which it sustains, and which are in all probability someway related to each other, and to the more abstruse causes of crystalline peculiarities. There is certainly in many points an analogy between annealed or suddenly cooled glass and tempered or hardened steel, and the extraordinary molecular and crystalline peculiarities of glass, when more correctly understood, may, perhaps, tend to throw some light upon the more obscure subject of steel, but as yet this is not the case. It is, however, by no means uncommon to find the same unstable arrangement of particles and inequality of tension in a mass of hardened steel, as in a lump of glass which has solidified in cold water; from the surface to the interior, successive crusts or coats of variable texture and hardness present themselves. Sometimes a steel die, after it has been for some time hardened and apparently safe, will split with an audible report, and its fracture will then exhibit a soft core covered by successive coats or layers, increasing in hardness from the center towards the exterior.

In addition to the difficulties arising out of the mass with which he has to deal, and the changes of texture, if not of composition, which it has necessarily been subjected to in the various operations of perfecting the impression from the punch in the press, the manufacturer of dies for medals or coinage has another obstacle to contend with, which is the necessity of keeping the face or work of the die perfectly clean and free from scales and oxydizement, so that it may not only be without any obvious blemish, but present that peculiar velvety line which so much enhances the beauty of the subsequent impressions in gold, silver, or copper: to this end the charcoal in which the die is imbedded, when it is heated previous to hardening, must be carefully looked to; it should be animal charcoal, and cyanogen, if present, is rather favorable than otherwise to the ultimate result; moisture, air, potassium, sulphur, and other things sometimes present in charcoal, are injurious; and when the die is at a proper heat and ready to be plunged into the hardening cistern, or submitted to the sudden action of a gush of water, all contact of air with the face of the die must be scrupulously avoided. Protecting pastes are seldom of much use.

The degree of hardness attainable by steel will depend upon the heat to which it had been raised, and the coldness of the water or other medium into which it is plunged; so that when very cold water cannot be procured, the die or other article must be heated proportionately high; a dull red heat into water at 34°, a cherry red into water at 50°, an orange heat into water at 80°, and a dull white heat into water at 100°, produce nearly the same effects; but the real hardness attained in water which is warm never equals that given by cold water; a red heat and water at 45° is the most desirable for die hardening; and although by subsequent tampering the die may, if necessary, be *brought down*, or softened, it is always safest to give it, if possible, its due hardness by the first operation. The risk of injuring the face of a die by oxydizement or scaling, or of *burning* the die, as it is usually called, increases greatly with a high temperature, and this is another reason why, in this particular branch, a moderate heat and very cold water is greatly to be preferred to a higher heat and warmer water. The hardening of steel when in thin bars, or other regular form, and where extreme cleanliness of surface is dispensed with, is comparatively an easy and certain operation.

The aspect of steel when so broken as to exhibit a clean fracture, varies from an uniform silky and even surface of an almost silvery whiteness, to a fine or even coarse grained texture, of a more blue or iron-like aspect; the finer-grained varieties are generally preferred, but no very important or at least unerring conclusions respecting its quality can be drawn either from texture or color. The microscope, however, enables us to observe some remarkable peculiarities in steel, not only in its varying texture as it comes from the manufacturer, but also before and after hardening. The fact of its dimunition of density after hardening, or in other words, the increase of bulk which it then sustains, has long been known. Steel, of the specific gravity of 7.738, was found by Hawksbee to be thus reduced to 7.704. Brisson found the density of good English steel to be increased by hammering from 7.833 to 7.872. After hardening, the former had decreased to 7.816, and the latter to 7.818. Dr. Thomson found the density of good blistered steel to be 7.823; when heated to redness and suddenly plunged into cold water its density was reduced to 7.747. The specific gravity of a piece of cast-steel he found = 7.8227; but when hardened only = 7.7532. (*Inorg. Chem.*, i. 497.) I have found even greater differences; and, in fact, the higher the heat to which the steel is raised, and the colder the medium in which it is cooled, the greater will be the resulting difference of density; for it is probable that the increased bulk attained by the steel under the expansive influence of heat, is retained by the suddenly cooled mass, and hence the peculiar state of tension into which it must be thrown when it has ultimately cooled down to the temperature of the atmosphere; and, indeed, it is surprising that masses of steel, which have undergone the process of hardening, are not more brittle and uncertain than experience proves them to be. According to Regnault, the mean specific heat of soft steel is 0.1165; that of hardened steel, 0.1175.

The quality of steel is sometimes tested by washing over its clean surface with dilute nitric acid, which ought to produce an uniform grey or blackish color; if the steel is imperfect, and contains veins or pins of iron, they become evident by their difference of color. When some particular kinds of iron or steel are thus tested, a mottled appearance is produced, as if it were composed of layers or wires of iron and steel welded together; hence is supposed to arise the peculiar character of the celebrated *Damascus* sword-blades.

* That the color produced on the surface of heated steel is the effect of oxydation, is proved from the circumstance that when steel is heated and suffered to cool under mercury or oil, none of the colors appear; nor do they when it is heated in hydrogen or nitrogen.

On a New Sulphid of Carbon.

Low, a German chemist, has described a new sulphid of carbon obtained by the action of an amalgam of sodium upon the bisulphid. When semi fluid amalgam of sodium is shaken with bisulphid of carbon in a well-corked bottle the temperature of the mixture rises, and the process is complete, when after repeated addition of the bisulphid heat is no longer evolved. If the mixture be then thrown into water, a blood-red solution is formed, which, after filtering, contains much mercury; by passing sulphureted hydrogen for some time into the solution, this may be removed. The dark-red solution is then to be poured into dilute chlorhydric acid with constant stirring. A flocky red substance is separated which aggregates to a tough resin, while much sulphureted hydrogen is given off. The resinous mass is to be washed continuously with hot water as long as it smells of sulphureted hydrogen. On cooling it becomes brittle, and then yields a violet-brown glistening power which may be purified by solution in bisulphid of carbon, filtration and evaporation. The new sulphid is but slightly soluble in alcohol and ether, but is readily soluble in bisulphid of carbon with a red color. It dissolves in the pure alkalies, as well as their carbonates, with partial decomposition, but appears to be taken up by alkaline sulphids without alteration. Concentrated sulphuric acid dissolves it with a red color and water precipitates it from this solution. Nitric acid of 1.5 attacks it violently and appears to form a new acid. Heated in a closed tube to 100°, the new sulphid melts to a tough resin, and remains in this state after the temperature rises to 150°. Sulphureted hydrogen is then given off. At 200° an amorphous yellow body sublimes, and on further heating much voluminous carbon remains. Analysis gave for the new body the formula $C_2 S_3 H$. The author explains its formation by the following equations:

I. $2C_2 S_4 + NuHg = 2NaC_2 S_3 + NaS.HgS.$

II. $2NaC_2 S_3 + NaS.HgS + HS = 2NaC_2 S_3 + NaS.HS + HgS.$

III. $2NaC_2 S_3 + NaS.HS + 3HCl = 3NaCl + 2HS + 2HC_2 S_3.$

Low regards the body $C_2 S_3$ as a radical analogous to cyanogen or methyl. The compounds of this radical with the alkaline metals are dark red to black and easily soluble in water; those with the heavy metals are brown or black precipitates.—*Wittstein's Vierteljahresbericht*, 1865, *vol.* 14, *p* 483.

OIL BORING IN COLUSA COUNTY.—We are indebted to M. S. Whiting, in 1863 State Senator from this city, for some information about oil boring at Oil Center, Colusa county, twenty-three miles in the foot-hills of the Contra Costa range, about 200 feet above the level of the Sacramento river, at the town of Colusa, which is twenty-three miles distant eastward. He is engaged with several gentlemen of this city in boring a well, which is now down 460 feet, and which has cost so far $30,000. The greater part of the distance the auger has passed through sandstone and shale. At a depth of fifty feet a vein of lubricating oil was struck; at 112 feet another vein; 217 another, and at 361 feet some shale, with the new color, known as Humboldt Blue. At 196 feet and at 380 feet again, specimens of petrified oak wood were found. The boring is still in progress. The well is filled with a strong salt water, the supply of which is not known, no attempt having been made to pump the well for fear of injuring it. Through this salt water there are frequent escapes of gas, which throw the water out of the well. For a period of thirty days while the auger was passing from a depth of 175 to one of 260 feet, the water rose three feet about 3 P. M., and again at 6 P. M., and soon after fell to the ordinary level. There is no known explanation for this tidal movement. After the auger passed a depth of 260 feet no tide was observed. In Antelope Valley, eighteen miles north of Oil Center, there is a salt pond, and in the vicinity is Salt Creek, which is saturated with salt about June, and becomes entirely dry in August, and during the rainy season has a barely perceptible saline flavor. The less the water the greater the proportion of salt. In Bear Valley, six miles west of Oil Center, a large deposit of sulphur has been found, and it is said that some has been sold to merchants in San Francisco.—*Alta.*

BARBAROUS LAWS.—As a specimen of the barbarity of some English laws, it is recorded that recently an old man committed suicide, being unable to endure the loss of his wife. He was buried at midnight, in contumely and disgrace, his property confiscated to the Crown, and his daughter left penniless.

A STORY is told of a Quaker volunteer who was in a skirmish. Coming in pretty close contact with one of the enemy, he remarked, 'Friend, it's unfortunate, but thee stands just where I am going to shoot,' and blazing away, down came the obstruction.

SALES OF THE WEEK

BY THE S. F. STOCK & EXCHANGE BOARD
No afternoon session.

Friday, April 13.
AFTERNOON SESSION.

From the Stock Circular of Associated Brokers of the S. F. Stock & Exchange Board.

SAN FRANCISCO, SATURDAY MORNING, April 21, 1866.

The money market presents rather more activity, owing in part to the opening up of trade with the interior, and the inauguration of a number of enterprises requiring the immediate use of considerable capital. Rates of interest are, however, unchanged, and still rule at 1@1¼ ₱ cent. per month in Bank.

Receipts of gold and silver from the mining districts, since the date of our last reference, amounted to $1,850,000, making an aggregate thus far, for the current month, of $2,700,000.

Shipments of treasure from Nevada are increasing, and during the month of April will, probably, exceed those of any former like period since September last.

Bullion is abundant, occasioned mainly by the light requirements for shipments East, and gold bars have been dull this week at 840@850. Silver is also in less request, and bars of average fineness may be quoted at ¾@1¼ ₱ cent. premium.

The deposits of gold and silver at the Branch Mint in this city during the past quarter (ending March 31st) amounted to $3,087,308.04. The gold coinage (mainly double eagles) was 2,549,000, and the silver coined amounted to $206,838. The receipts of gold were, in part, as follows: From California, $1,707,772.63; from Idaho, $338,472; from Montana, $198,574.44, and from Oregon, $131,911.36. From Nevada $164,265.36 was received in silver.

The Mining Share market has exhibited rather less animation since Saturday last, and the aggregate sales are lighter than for some time past. Some stocks have been subjected to a material decline, while others are in better favor and are firmly held at the close. Advices from Nevada are, for the most part, favorable, and a large number of mills are now kept constantly employed.

Crown Point rose to $1,375, ex-dividend, receded to $1,350, rallied to $1,370, and then sold at $1,365. During the week ending 14th instant, 783 tons of ore were extracted. The south drift (main lode) now 290 feet from the north line, and 190 feet south of south incline, continues to look very promising, the body of ore widening and of good quality. More than 3,000 tons of ore will be reduced this month, and the receipts of bullion will probably equal those of March. It is thought that more ore is now disclosed than at any former period in the history of the mine.

Savage has been well maintained, and some 40 feet were dealt in, advancing from $1,095 to $1,120, and selling yesterday at $1,110@1,100. During the week ending 14th instant, 266 tons of ore were hoisted to the surface, as follows: 28½ tons first-class, from the old North Potosi chimney, valued at $250 per ton; 186 tons, 2d-class, valued at $35 per ton, and 51 tons, 3d-class, at $20 per ton. In the upper levels the reserves left from former workings still contain a small amount of fair ore. A small opening was made last week in the 6th level, but the drifts have now reached the best ore seam lying to the east, and a large quantity of ore will soon be taken from the mine. Work has been commenced upon the main shaft from the 6th level for a new station 100 feet deeper.

Gould & Curry met with small sales, receding to 900, seller 30, and closing at $925 asked. There is no new feature in this claim. Drifting continues vigorously north and south from the 4th station. Receipts of bullion during the first half of this month exceeded $80,000, and the company's mill is reducing an average of about 100 tons of ore per day.

Hale & Norcross has been sold within a range of 920@930, closing at $945@950. Some 1,550 tons of ore were crushed last month, yielding $64,092, or an average of $41.35 per ton. The company are now employing three mills, and hoisting 50 to 60 tons of ore per day. The 7th level is said to be looking as well as ever. The incline being sunk from that level is prospecting at the rate of 2½ feet per day.

Yellow Jacket rose from $810 to $850, receded to $810, and closed yesterday at $760@770. The entire cost of crushing 2,317 tons of ore at the company's mill last month was $11 per ton. During the week ending April 2d, 1,142 tons were extracted. The lower level, south mine, is said to disclose a body of ore 30 to 35 feet wide.

Ophir has attracted considerable attention, and nearly 400 feet were dealt in, advancing from $845 to $865, receding to $792½, rallying to $825, and selling yesterday at $775@765. Latest telegraphic advices state that the mine continues to present a flattering appearance, and that the body of ore in the 9th gallery is widening and improving in quality as ascended upon. Recent returns from different mills will, it is thought, show an average of $90 per ton for most of the ore crushed. Receipts of bullion since 1st inst., amounted to $73,000.

Chollar-Potosi has been in less request, and about 250 feet were sold, steadily declining from $365 to $307½, and closing at $305@314. In drifting south from the lower stope of the Bajazette ground, a body of good ore, nearly eight feet wide, has been met with. There is no improvement to note in any other portion of the mine. The drift from the new shaft is now in some 240 feet. During the week ending 13th inst., 913½ tons of ore were sent to Custom mills.

Alpha is dull and inactive, and small sales have been made at $450 @425 per foot, closing at $425 asked. The debt of the company at this time exceeds $90,000. Belcher declined from $370 to $342, and sold yesterday at $340@345.

Empire Mill and Mining receded from 200 to 193, and closes at about $200 asked.

Imperial has been very steadily maintained this week, advancing from $149 to $155, receding to $149, and selling yesterday at $150@148. The first clean up of the Gold Hill mill, and the second of the Rock Point mill, amounts to $24,267, making the aggregate for the first half of the month $36,726. This is a decided improvement over last month.

Bullion declined from $115 to $102½, then sold at $116, assessment delinquent, and closed at $115 bid.

Overman rose from $74 to $85, buyer 30, receded to $75, rallied to $80, and sold yesterday at $79@78.

Confidence was dealt in at $39½@38, closing at $36.

REMINGTONS'
ARMY AND NAVY REVOLVER,

THE REMINGTON REVOLVER

Has been approved by the United States Board of Ordnance, and has so satisfactorily met the requirements of the Government, not only in the field, but in the official tests and examinations made by prominent officers of the Ordnance Department, that it stands at once the most popular, serviceable and approved arm of the kind in use. Upwards of 12,000 have been supplied to the Government within the past four years, for the land and naval service, furnishing ample evidence of the estimation in which the arms are held.

Simple and symmetrical in its entire construction, securely strong, of most modern improvement in mechanism and material; its unequaled range and penetration, together with its durability, are points in its favor now well known, and which challenge a comparison with any other pistol of the kind made in this country or in Europe.

The superior strength and capacity of the arm for constant and long use is apparent from the fact that the entire frame is constructed of a single piece of metal, thus preventing the extension of some portions of the frame, from the effect of firing—a serious defect in many pistols—in which the frame is composed of two or more parts.

The frame of the Remington Revolver furnishing a TOP STRAP or support above the cylinder, served to protect the base pin (on which the cylinder revolves) from any undue strain to which it would otherwise be subjected, and which would immediately render the line of fire from the cylinder to the barrel imperfect, thus destroying force and accuracy.

Another advantageous feature of the arm is the means afforded for the instantaneous removal of the cylinder from the frame. This not only facilitates the cleaning of the pistol, but by the quick adjustment of the cylinder, one pistol can be made as effectual as two—and, considering the difference of weight, it is far preferable—by simply possessing a spare cylinder loaded and capped to instantly replace the exhausted one.

The above is a general summary of the points of peculiar merit in the Remington Revolver which a trial of the arm is only needed to attest. For sale at Manufacturers' rates, by

WORDS FOR MINERS.—The Gold Hill *Daily News*, Nevada—a medium of good authority—saith thus:

The MINING AND SCIENTIFIC PRESS is a weekly journal, published in San Francisco, which is entitled to the subscription patronage of every practical miner in Nevada, and every person interested in Nevada or California mining operations. It is a well gotten up sixteen-page quarto; and its reading would tend vastly to the particular "post-log" and general enlightenment of our sort of working folks. Subscribe for it. Five dollars a year; three dollars for six months. It should have an agency in Virginia and Gold Hill; but we see none advertised in its columns. Every new improvement in mining implements and operations are fully described by words and illustrated by wood cuts in this excellent publication. A specimen number can be seen at our office.

Mining Summary.

CALIFORNIA.

The production of both the placer and quartz mines of California is progressing very satisfactorily at the present time. The abundance of water has imparted unusual activity to the former, and enabled work in the "dry diggings" to be continued much later in the season than usual. Many new placers have been discovered, while numerous old ones have been worked over with large profit. Perhaps, however, the most important improvement in placer mining may be found in the increased attention which is being given to what are known as "cement diggings." It has recently been discovered that a large amount of "cement," which has hitherto been considered worthless, will pay well when subjected to a mill process. One in particular, at French Coral, has been kept constantly and profitably at work for the past two or three months, upon cement that had been previously thrown away as worthless. Quite a number of new mills for working this class of gravel have been put up within a few months past, and many others are in contemplation.

In the quartz districts the promises held out last autumn have been more than realized, and the yield of bullion from this source is constantly increasing. The heavy experiments in deep mining about Grass Valley are resulting most favorably, and present a most strikingly favorable contrast with similar operations in the silver regions to the eastward of the Sierra Nevada. As the condition of the mines always reacts upon all other developments of industry in the State, we may reasonably look with much confidence for a most successful business season during the current spring and coming summer and fall. We append our usual summary for the week:

The Shasta *Courier*, of April 14th, learns, on tolerably good authority, that two men, engaged in working a claim some two or three miles from the town of Shasta, have been realizing for the past six or eight weeks one pound of gold dust each per day from their claim. It is said they are working on a ledge, and find the gold in seams about an inch wide, imbedded in quartz. They take it out, pound the mass in a hand mortar, and amalgamate the gold with quicksilver. It is further said, that the sum total of the earnings of these men amounts in the aggregate to over $13,000. The *Courier* is promised further revelations.

Plumas County.—The only item of interest for this county which we have noticed the past week is the statement in the Quincy *Union* that Major Love has recently discovered a rich copper ledge in the canon of Indian Creek, and about three miles below Indian Valley, which prospects very rich.

Sierra County.—A new discovery of rich gold bearing quartz is reported in the Downieville *Messenger*, about one mile northeast of town. It is plentifully spangled with free gold James Meserve is said to be the lucky discoverer.

A correspondent of the *Messenger*, writing from Howland Flat, says that considerable dirt has been run off there during the winter in the hydraulic claim; but the profits are not great, as the attending expenses were much increased on account of the unsteadiness of the work through the weather's ever-changing freaks. The winter season, though not causing the suspension of work in tunnel mining, is always sufficient to make a difference very perceptible in the profits. Our tunnel claims have more generally paid well this winter than at any time heretofore, and with the loss of snow, the prospects of a general gold yield beyond other years, is decidedly good.

Comparatively speaking, our hydraulic mines are "played out." They now form but a small proportion of the mining of this place and vicinity. At Rabbit Point and Chandlerville, however, there are some good claims. The Campbell boys and Snow claims stand first as paying ones.

The creek or tailing claims form an important branch in mining here, and will be extensively worked the present summer, with a very good prospect of success. The high waters of last fall and winter have washed away large quantities of tailings that have laid uncovered since '61, and left the beds of creeks and ravines exposed, so as to ensure profitable working.

The same correspondent thinks that economy in mining is very generally overlooked there, and many disastrous failures must be entirely attributed to this cause. He can scarcely recall to mind a claim wherein there has not been a wanton and wholesale butchery of ground, and valuable rich dirt been made to yield nothing above expenses. Still, some in opening claims are loth to adopt any other than the "good old way" and plan of working. To remedy this evil a county convention of miners is suggested to compare notes, and to discuss the modes of working such claims as are found there, from a practical point of view. The writer thinks that local miners' conventions would be much more profitable than State or national conventions. By free conference, laws governing mining might be adopted to suit each locality, and still be so general and plain as to obviate greatly costly and injurious litigation in the future.

Placer County.—The Auburn *Stars and Stripes* says that the Minerilla quartz claim in Baltimore Ravine, near Auburn, owned by Messrs. Mallett and Havey, is one of the best in the district. The ledge is about a foot in width, and the rock taken from a shaft sunk on the ledge to the depth of thirty feet shows considerable free gold. Five tons of the rock taken from near the surface, and crushed in an arastra, yielded over an ounce of gold to the ton, while a good prospect was obtained from the tailings. They are now taking out rock which they believe to be much richer than that which they crushed. Messrs. Mallett & Havey are now negotiating for a mill, which they design erecting upon the ledge, and which no doubt will prove a remunerative enterprise to them. They are also about commencing a tunnel to strike the ledge below the bottom of the shaft—a work which will greatly facilitate the getting out of rock.

Calaveras County.—A rich lode of gold-bearing quartz was recently discovered near San Andreas by a Mexican in the employ of B. K. Thorn and Wm. Irvine. The lode runs across Willow Creek, near a point where, in early days, gold was taken out in pound nuggets. The discovery created quite an excitement among the miners of San Andreas.

Tuolumne County.—A rich pocket of quartz is reported to have been found in the city of Sonora, Tuolumne county.

Amador County.—The Belding mine, located about ten miles southeast of Volcano, according to the Amador *Ledger*, is producing a large amount of gold, considering the facilities for crushing the rock. They have a little mill of five stamps, and with this they are crushing from four to five tons of rock per day, which yields, on an average, one hundred and ten dollars to the ton.

A correspondent from Volcano writes to the *Ledger* that quartz mining in that vicinity is constantly improving, and that another mill will soon be put up there by the Sorocca Brothers and McLain.

The Golden Gate, owned by Mr. Hurd, is being pushed ahead with vigor under his own supervision. The mill is driven for the present by an overshot wheel thirty-five feet in diameter. It is a good one, and contains two of Hendy's sulphuret concentrators. A 40 horse power engine has just been erected, which will be put in operation as soon as the water fails. They are now crushing fifteen tons of rock per day, which pays from $20 to $40 per ton.

Mariposa County.—Henry & Co.'s smelting works on the Lone Tree vein at James' ranch, are turning out copper pretty rapidly. One hundred and eighty bars were smelted between Sunday morning and Tuesday night.

The Mariposa *Gazette* of April 7th says "a great many tons of pure copper have been smelted within the last few months at the Chowchilla copper mines, and that the veins increase in width and quality as they go down. The vein at Buchanan Hollow is five feet thick, and of the richest carbonates. Thursday last, Mr. Haskell operated with his smelting works twenty-seven hours, and the product of copper, in pigs, during that time, was *two tons and a half*. We doubt whether similar results can be shown since the organization of the State."

Tulare County.—A correspondent of the Visalia *Delta* says that the Long Tom lode, which was originally but two and a half feet wide, is now, at the depth of 140 feet, about *seven feet wide*, has paid richly all the way down, and now averages across the entire seven feet, *seventy dollars per ton*. The new mill is working finely, and crushing regularly about one hundred tons per week. Other lodes are being prospected here, with apparently equally good indications, and two or three mills might now be erected to advantage.

George D. Roberts & Co., the proprietors of this lode, may be set down as among the most fortunate quartz operators on the coast. Ex-Governor Wm. Bigler, of Pennsylvania, and J. C. Birdseye, of Nevada City, are now putting up a 20-stamp mill, W. W. Boston, of this place, having the contract for the work.

Five additional quartz mills are being erected in the Clear Creek mining district.

Nevada County.—William N. Mitchell of the Wisconsin Hotel, Grass Valley, recently purchased a two and three-quarters interest in the Stockbridge mine, paying therefor eleven thousand eight hundred dollars. The Stockbridge is the continuation of the famous Massachusetts Hill lead, which is considered one of the most valuable quartz mines in the State.

We learn from the Grass Valley *Union* that the company owning the Mohawk claim, a short distance from Larimer's mill, are running a tunnel to strike their lode. The proprietors are C. C. Smith of the Exchange Hotel, Whitney, Ross, Larimer and others. This is said to be one of the most promising of the recent locations in that neighborhood.

The Grass Valley *National* gives some interesting quartz items from the town of Rough & Ready: On Thursday of last week, a crushing of seven tons of rock from the Ault & McCauley ledge was had, which yielded thirteen dollars to the ton—the rock being taken from a depth of twelve feet from the surface. A few days since a small crushing of rock taken from the Washington claim, on Posey Ravine, at a depth of thirty feet from the surface, yielded twenty dollars to the ton. A crushing from another ledge, the name of which we have not heard, yielded fourteen dollars to the ton. Several new discoveries have been made, which pay from five to nine dollars per ton, almost from the surface; in many cases pay rock being found at depths varying from five to ten feet.

We learn from the Nevada *Gazette* that a new and promising discovery has recently been made by Mr. H. Southard, a short distance above the Star Spangled Banner.

Some thirty or more tons of rock, from the northerly extension of the Star Spangled Banner, crushed recently at Stile's mill, yielded a little over eighteen dollars a ton. This is considered a good yield, being sufficient to pay a fair profit, with the prospect of striking better rock at a greater depth. The rock was taken from a shaft about eight hundred feet north of the Banner works. The extension is owned by Tisdale and Stiles. The southerly extension of the ledge has never been found.

A third extension northerly of 1,500 feet, has been taken up by Messrs. Tisdale and Niles of Nevada, and Hallidie and others of this city.

Heughs & Thom, proprietors of the Nevada Foundry, are manufacturing an engine and other machinery, for hoisting and pumping purposes, to be erected on the Barrington ledge, at Willow Valley. The work of putting up the machinery on the ledge will be commenced in a few days.

ESMERALDA, NEVADA.

The Esmeralda *Union* of April 7th, says that the Golden Age & Empire company have resumed work on their deep shaft on Last Chance Hill and intend to prosecute the work vigorously till a depth of five or six hundred feet has been attained. As soon as the machinery is put up, Mr. Benson, the Superintendent, will put on as large a force of men as he can find room for in order to push the work ahead with all possible speed. The finances of the company are in good condition. The sinking of this shaft and the running of a few side drifts from it, will give the mines of Last Chance Hill a more thorough test than they have ever had before.

On the 30th ult., the Baldy mining district was organized by the adoption of a code of mining laws and the election of T. N. Brown, Recorder. The mines of this new district were lately discovered and located about twenty-five miles almost east of Aurora. Wood is abundant in the vicinity of the mines, and water can be easily obtained by digging. A New York company has already located several claims, which they intend soon to commence developing in an energetic manner. Specimens taken principally from the croppings of three claims—the Mitchell, Constitution and Golden Fleece—show considerable quantities of free gold, and appear to be rich in silver also. One of the ledges is over fifty feet in width. These mines have been so recently discovered that very little is known of them yet, but from the specimens shown us we think they will prove to be astonishingly rich.

Mr. M. DeKay had two and a half tons of quartz crushed at Poor's mill on the 4th inst., which yielded the handsome sum of $1,016. The rock was taken from a rich spot in a small lead on Middle Hill.

HUMBOLDT.

Elzy, working the Monroe Series, informs the *Register* that he has just received the crude bullion from 5¾ tons of quartz worked at Holt's mill. As nearly as they can judge before melting, the yield is about $800 to the ton—which is better than—well, better than any of *our* mines ever panned out. Elzy is still sinking, taking out rich quartz; and Tom Rule and other worthy boys have got the same ledge in an extension claim.

The boys continue stripping Ledge No. 1 of the Silver Bullion series, prepartory to sinking. Parkinson brought up, Tuesday, April 3d, samples of very rich rock from it.

VIRGINIA CITY AND VICINITY.

The prospecting season seems to have commenced in Washoe. Numerous prospecting parties appear to be starting out for the various districts already known, and to look for new ones. Work at the mills and upon the mines is unusually active at the present time, and things generally wear a healthy aspect. From the Crown Point, Yellow Jacket, Imperial and other prominent mines at Gold Hill, very rich ore is now being taken out, and the supply of the article is said to be decidedly on the increase.

Mining operations about Virginia City are also progressing favorably. The value of the bullion shipped from the office of Wells, Fargo & Co., at Virginia City for the week ending April 15th, consisted of sixty-six bars, weighing 4,518 pounds, and valued at $117,796.

We have nothing especially new from the Ophir for the past week. The Sierra Nevada company are progressing finely with their new shaft, having their engine and hoisting works in full operation. The new shaft is some 300 yards east of the old works.

The main shaft of the Challenge mine is being sunk deeper in order to get more fully at the rich bodies of ore known to exist below the lower levels. The shaft is now a little over 600 feet deep, and Lem Colbath, the efficient Superintendent, informs the *Enterprise* that it is his intention to sink to the depth of 750 feet, which will be considerably below any depth yet attained in the mine. Meanwhile, ore enough is being hoisted from the mine to keep the Comet mill running steadily.

Mr. Osborne, Recorder of the Truckee district, is sanguine that New Truckee will prove one of the richest districts in the State. Water is scarce in the immediate vicinity of the mines, but an artesian well is being bored, and it is thought a good supply will soon be obtained.

We learn from the *Enterprise* that the Connecticut & Nevada mining company of Mountain Wells district, J. S. H. Hall Superintendent started up their 10 stamp mill on the 13th instant. The mill is in the town of Averill, about three miles east of La Plata. It is working rock from a lead found by the company in running a tunnel for the Satellite lead. The ore assays from $250 to $350 per ton, and the lead, from wall to wall, is about fourteen feet defined. The Satellite tunnel is now in a distance of 750 feet, and it is thought that by running 150 feet further the lead will be struck. The croppings of the lead are about six feet in width, and prospects in gold and silver about $80 per ton. The company own a number of leads in the vicinity of their mill which they are developing.

Of the other claims in this company, the Silver Spoon has a shaft down 200 feet, and are taking out ore from a 9 foot lode. The Washington has a tunnel in 250 feet. The affairs of the company are said to be in a flourishing condition, and now that they have got their mill started they will begin to get back the coin expended in opening their mines.

From the Kearsarge, Mr. J. H. Mills reports to the *Enterprise* that the mill of A. B. Paul is nearly ready to start, and will commence crushing ore from the famous Kearsarge mine at once. The Kearsarge company are busily at work developing their valuable mine. Some ten tons of the ore are on the way to be tested at Dall's mill, Washoe Valley. Mr. Mills thinks Kearsarge is one of the richest districts, if not the richest yet discovered. Among the rich and promising ledges he mentions the Giant, which may prove to be the richest of all. The old Kearsarge, though, is the only ledge where any work of consequence is being carried on. Over $20,000 have been expended on this noted mine, and the whole is owned by citizens of Gold Hill, all of whom are sanguine of their claim yielding them rich returns.

Denominationalism Extraordinary.—While urging the united efforts of Christians of every name to reach and rescue the neglected masses of our country, one of the speakers at the convention in Cleveland related an anecdote that showed that the word 'denomination' was not restricted to its theological meaning. A western farmer who wished to invest the accumulations of his industry in U. S. securities, went to Jay Cooke's office to procure the treasury notes. The clerk inquired what *denomination* he would have them in. Having never heard that word used except to distinguish the religious sects, he, after a little deliberation, replied, "Well, you may give me part in Old School Presbyterian to please the old lady, but give me the heft on't in Free-will Baptist."

The water that flows from a spring does not congeal in winter. And those sentiments of friendship which flow from the heart cannot be frozen in adversity.

THE RISE AND FALL OF CHIVALRY.

Previous to the days of cheap printing and "yellow covered literature," the stories and romances of knight-errantry were generally among the first reading books to find their way into the hands of young men and young ladies. Whether the access of the more modern class of light reading is a loss or gain, may be difficult to determine, where so little of positive value is to be found in either. The general impressions left upon the mind, after reading the romances founded upon the events and condition of society in the middle ages, has ever appeared to us less injurious than those derived from the more modern class of light literature. Without, however, discussing the merits of either, we have prepared for the readers of the COMPANION a brief synopsis of the rise and fall of chivalry, which cannot fail to interest many, and may be valuable, as a correct outline of a most interesting portion of the social history of modern times:

Chivalry had its origin about 500 years after the birth of Christ, and during the decline of the Roman Empire. The northern and western countries of Europe were, at that time, almost destitute of national government. Whatever existed of such power was concentrated in numerous chiefs, more or less powerful as each one could enforce his power over the inhabitants around him. Sometimes these chiefs would combine for the accomplishment of a common object; but ordinarily they were hostile to one another, and constantly waging little petty wars one with the other.

In such a state of things the rights of the humbler portions of society were very little looked after; and the individuals of that class were exposed to the hostile attacks or gross impositions from whatever assailant might choose to manifest any unfriendly disposition toward them. As the power of the Roman Empire gradually grew weaker, this condition of things grew more and more alarming; until the inhabitants of those countries seemed about to relapse into the barbarism from which the civilization of the Romans had raised them. The church made vain efforts to stay the downward progress, but it was too much degenerated of itself to stop the evil which was threatening the very existence of society.

But ere the last spark of generosity and sense of right was crushed under the weight of passion and selfishness, the dawning of chivalry made its appearance, and formed a crude ideal of heroism; combining valor, justice, loyalty, modesty and courtesy.

The term chivalry was derived from the French *cheval*, a horse; from the fact that the chivalry were mounted men.

The term knight was originally applied to boys or servants. The chivalry became the servants of the innocent and oppressed; hence those who went forth on chivalric errands were termed knights. This privilege was granted only to young men of fortune or noble parentage. The masses were not allowed to carry arms. A knight was now transferred from a servant or menial to a mounted warrior—a man of rank.

At first the knights confined themselves to their own localities, and employed their time in redressing wrongs and preserving the peace. They established a sort of independent mounted police in time of peace; tendering their services to their acknowledged chiefs in time of war. They were also much in attendance upon the person and at the courts of their chiefs.

They were very fond of adventure, especially when accompanied with daring and danger; this disposition gradually led them to traverse the country far and near in search of it. They set forth on errands generally for redressing wrongs and enforcing rights; but often for the fulfillment of some vow of religion or love. These wandering knights were called "knights-errant." They were everywhere welcomed to the castles of the nobles, where they were usually entertained with banquets, and where tournaments were often given, wherein they might display their valor and skill.

This roving disposition soon led to degeneracy, and the justice at first administered by this instrumentality declined from its early purity to that of the rudest description. The power which was originally organized to redress wrongs, gradually became a most powerful agent in the infliction of wrong, and the knightly castles soon became dungeons for the incarceration of oppressed and innocent knights and ladies who chanced to incur the displeasure of the more powerful of their class.

With the revival of letters came another change, and this time upon a grander basis. The more cool and dispassionate of the nobles united in putting a stop to rampant chivalry, which was generally compelled to give way before the light of reason and education; until the reign of law became supreme, and the civil magistrate took the place of the mailed champion of right. The last spark of chivalry was finally extinguished by the ridicule heaped upon it by Cervantes, in his inimitable volumes of Don Quixote.

City College Laboratories,

Southeast Cor. Stockton and Geary sts.

Practical and Analytical Chemistry and Metallurgy.

THOMAS PRICE,

Professor of Chemistry,

(Formerly of the Normal College, Swansea,)

WILL GIVE PRACTICAL INSTRUCTIONS IN QUALITative and Quantitative Analysis and Assaying. The course qualifies students for the application of Chemistry to METALLURGY, MANUFACTURING ARTS, and MINING PURPOSES.

PHARMACEUTICAL and TECHNICAL CHEMISTRY, such as is required by Medical and Pharmaceutical Students, will be taught to such students as may require it.

Course of General Chemistry.

Evening Lectures will be delivered every Tuesday, at half past seven o'clock, P. M., in the Philosophical Hall of the College, without extra charge to the students in the Institution.

On and after the 14th of February, the Laboratories will be open every day, except Sundays, from 8 A. M. to 5 P. M. For further particulars, address

REV. P. V. VEEHER,
Principal of the City College.
6v12tf Or at 405 California Street.

SANTA CLARA COLLEGE, S. J.,

SANTA CLARA, CAL.

Conducted by the Fathers of the Society of Jesus.

The FIFTEENTH ANNUAL SESSION of this College will commence on

Monday, August 28th, 1865.

TERMS—Tuition in the Classical and Scientific Department; Boarding and Lodging; Washing and Mending of articles washed; School Stationery; Medical Attendance and Medicine; fuel, light, baths, etc., per session of ten months..... $350

For further information and catalogues, apply to the President of the College, or to Rev. A. Maraschi, St. Ignatius College, Market street, San Francisco.
3v11 REV. A. MASNATA, S. J., President.

SACRAMENTO SEMINARY.

BOARDING SCHOOL

FOR YOUNG LADIES,

Tenth Street, between F and G.

Session commenced January 8, 1866.

MR. AND MRS. HERMON PERRY,
7v12tf Principals.

A Good Financial Weekly.

The Stockholder:

MONITOR OF FINANCE AND INDUSTRY,

Is published every Tuesday Morning,

At 72 William street, New York,

—GIVING—

Quotations of all important Bonds and Stock Securities in the United States; GOVERNMENT, STATE, CITY, BANK, INSURANCE, PETROLEUM, MINING, and other miscellaneous Joint-Stock Organizations, with the Financial Statements of the same; Notices of Payment of Interest and Dividends—

fact, all matters that can be of interest to Security-holders.

Its columns will be found replete with important and useful financial information.

The Quotations given are correct, and may be relied upon either for the purchase or sale of Bonds or Stocks.

THE STOCKHOLDER is the *only strictly financial paper published in the United States.*

TERMS, FIVE DOLLARS PER YEAR.

All letters should be addressed,

GEO. M. NEWTON, Publisher,
5v12tf 72 William street, New York.

JOHN TAYLOR & CO.

IMPORTERS,

AND DEALERS IN

ASSAYERS' MATERIALS,

Druggists' & Chemists' Glassware,

Photographic Stock, Etc.

512 and 514 Washington Street,

SAN FRANCISCO.

WE are receiving direct from MESSRS. LADD & OERTLING (London) and BEEKER & SONS (Antwerp, Belgium) their superior

ASSAY AND BULLION BALANCES,

And from France and Germany, as well as the Eastern States, FURNACES, CRUCIBLES, MUFFLES, BLOW-PIPE CASES, GOLD SCALES, CHEMICAL GLASSWARE, and every article required for ASSAY OFFICES, LABORATORIES, etc. We have given this branch of our business particular attention, to select such articles as are necessary in the development of the mineral wealth of this coast.

A Full Assortment of DRUGGISTS' GLASSWARE and DRUGGISTS' SUNDRIES, ACIDS and CHEMICALS, constantly on hand.

San Francisco March 6, 1865. 11v10-tf

ENGRAVED TO ORDER.—Persons who desire to illustrate their individual establishments or business, should give us their orders for Engraving and Printing, and we will guarantee good work and reasonable prices.

VOLUME TWELFTH.—The MINING AND SCIENTIFIC PRESS, with its last issue, commenced its twelfth volume. Since Dewey & Co. have "held the ribbons" its gait has been rapid toward a perfect journal. Its appearance evidences its prosperity, but doubtless, like some of the rest of us, it can stand increased encouragement. Let such be given, and, our word for it, volume thirteen will acknowledge receipt.—[Golden Era.

It Is Impossible for editors to know ALL the merits and demerits of their correspondence, consequently the reader must not receive the opinions of our contributors as our own. Intelligent discussion is invited upon all sides and the evidence of any error which may appear will be received in friendship and treated with respect.

American and Foreign Patents.—Letters Patent for Inventors can be secured in the United States and foreign countries through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past two years.

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the MINING AND SCIENTIFIC PRESS, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

Payment in Advance.—This paper will not be sent to subscribers beyond the term paid for. The publishers well know that a good journal cannot be sustained on the credit system.

Mr. Wm. R. Bradshaw, is our Special Correspondent and Traveling Agent. All favors or assistance rendered him in his progress through the country in behalf of our journal, will be duly acknowledged.

SAN FRANCISCO, Jan 1st, 1866.

Mr. A. C. Knox, is our fully authorized Traveling Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office.

SAN FRANCISCO, Jan 11th, 1866.

Mr. I. N. Hudson, is authorized to solicit subscriptions, advertising, etc., for the MINING AND SCIENTIFIC PRESS, in San Francisco, and to receipt for the same.

San Francisco:

Saturday Morning, April 21, 1866.

INAUGURATION OF THE STATUE OF LINCOLN.—The statue of Lincoln, in front of the Lincoln School House, was inaugurated according to notice, on Saturday last. The ceremonies were witnessed by a large concourse of people. Several prominent speakers were introduced, whose remarks were fitting for the occasion, and listened to with much interest by all present. The opening commenced with the unveiling of the statue; the boys of the Lincoln School chanting the Lord's Prayer, accompanied by Willis' brass band. Mr. Badger then introduced Rev. Chas. L. Ames, who offered up a prayer to God for the preservation of the nation, which Lincoln as it were died to save. The inagural address was then delivered by J. W. Winans. Rev. Dr. Stone, Col. Hawkins and State Superintendent J. Swett made appropriate remarks. Extracts from Lincoln's last Inaugural were read by Professor Knowlton; the singing of "America," accompanied by the band, concluded the exercises.

NEW MODE OF DESULPHURIZING.—Messrs. Tait & Avie, of New York, have patented a process of desulphurizing sulphurets by a current of heated, compressed air, impelled by an air pump, in combination with a closed furnace containing the ore. They also claim in their process the use of nitro-oxide gas in combination with atmospheric air; also the use of steam in combination with the heated air.

A NEW MATERIAL for soling shoes has made its appearance at the East. It is a substance of which India rubber is the basis, but it is heavier, and, while as solid as iron, is flexible and elastic. It is said one pair of shoes soled with this article will outwear four pairs soled with the best English leather.

BUTTE CITY.—This once flourishing place, three miles from Jackson, has pretty much "gone in." The ground on which it stood has been nearly all washed down the gulch, and but three or four houses now remain to mark the spot where once dwelt the inhabitants of Butte City.

THE PATENT OFFICE.—One hundred and seventy-eight patents were to have been issued for the week ending March 20th, 1866. This is the second highest number ever issued in one week, the highest amounting to one hundred and eighty-four for the week ending July 25th, 1865.

THE LATE TERRIBLE DISASTER.

A few minutes after one o'clock P. M., on Monday last, our citizens were startled by a terrific explosion, the peculiar sharpness and great force of which astonished every one. So unlike was the report to that produced by the explosion of gunpowder or of a steamboiler, that every one instinctively asked: "What is it." No one for a moment appeared to think it could have been the effects of either powder or steam. On finding that it had occurred in the rear of a chemical laboratory, the impression at once obtained was that it must have proceeded from some kind of chemical compound not in ordinary use. Nitro glycerine was at once suggested; and subsequent investigations proved that supposition to be correct. The character of the report had all the sharpness of the crack of a rifle, while the tremendous concussion produced was greater even than that of the heaviest ordnance. Just such a report might be readily expected as the result of exploding a large quantity of that terribly effective agent, whose explosive power is said to be thirteen times that of gunpowder, when volumes are compared, and eight times its power when weight is considered. The effect was so great as to shake the earth, like an earthquake, for a circuit of a quarter of a mile. A full and complete account of this preparation, its wonderful explosive power, its chemical constituents, etc., together with a description of the mode of using it, illustrated with numerous engravings, was given in the MINING AND SCIENTIFIC PRESS of the 23d and 30th of December last.

The explosion occurred in an open yard or area in the rear of Wells, Fargo & Co's express office, the entrance to which was from California street, near the corner of Montgomery, and between the building occupied by the banking department of Wells, Fargo & Co. and J. C. Bell's assay office. The immediate cause of the explosion was supposed to have been the attempt to open a box containing several packages of nitro glycerine, one or more of which packages had undoubtedly been broken, allowing the fluid to find its way out of the box. The box was being opened to ascertain the nature and amount of the damage sustained, and without any knowledge whatever of what were its contents, as there was no mark upon the box itself or the accompanying way-bill, by which that fact could be ascertained.

It appears, from the testimony before the Coroner's Jury, that the parties opening the box were using a hammer and chisel, and the natural inference is that a blow from the hammer upon some part of the box saturated with the oil was the immediate cause of the explosion. Experiments made within the past few days upon small fragments of wood saturated with the oil, show that the oil contained, in even a very small chip scraped off with a pen-knife, may be thus exploded, with a report equal to that from a pistol.

The box measured, according to the freight clerk's record, a fraction over fourteen cubic feet. It was placed on the ground about six feet distant from the outer wall of a store room. This wall, which was of brick, one foot thick and twenty-five feet high, was completely demolished for the length of thirty feet, while the rear wall of the room was also badly shattered and cracked. All the brick walls around the area within the distance of twenty-five feet were badly shattered. The hard ground beneath where the box was lying, presented a depression to the depth of about one-and-a-half feet—probably in a great measure pressed downward by the force of the explosion.

The scene presented along California street to a short distance below Montgomery, and along Montgomery for the distance of several hundred feet, throughout the entire of the three story building in which Bell's assay office was located, and the entire of Wells, Fargo & Co's building, quite to its front on Montgomery street, can scarcely be conceived by one who did not see it. The fragments of glass, window-sash and shutters, covered the sidewalks and streets; while numerous fragments of the three unfortunate victims who were examining the box were picked up from the street, sidewalks and the tops of the buildings, upon and over which they were thrown for the distance of an entire block.

The loss of life was terrible. Eight persons were killed instantly, and three more died of their injuries two or three days afterward. Quite as many more were seriously wounded. The names of the killed are as follows:

Samuel Knight, Superintendent of Wells, Fargo & Co.'s express; G. W. Bell, assayer and member of the Board of Supervisors; F. E. Webster, clerk in the New York department of the express; William H. Haven, freight book-keeper of the Pacific Mail Steamship Company; William D. Jester, porter with Wells, Fargo & Co.; Felix Durivault, first cook at the Union Club; John Gallagher, hostler in Wells, Fargo & Co.'s stables; Dennis O. Donnell, waiter at the Union Club.

The results of this terrible calamity will probably prevent any further attempt at an immediate introduction of this new agent into general use for blasting purposes; although a more intimate acquaintance with its nature and properties, such as future researches will doubtless give us, may yet render it as safe as any other explosive compound. We are informed by Mr. Messrs. Bandmann, Neilson & Co., the sole agents for its sale in California, that they telegraphed to their principals ten days before the late explosion, that they had better discontinue any further shipments, until further orders.

In justice to Messrs. Bandmann & Neilson it should be stated that those gentlemen had nothing whatever to do with the shipment of the box which produced this terrible disaster. Their shipment was forwarded directly from the steamer's wharf to a safe deposit in a powder house on the Potrero. The shipper of the exploded box is unknown, although measures have been instituted by telegraph to ascertain who he is. It was addressed to "W. H. Mills, Los Angeles."

We hope to give some new facts, of scientific and general interest, bearing upon the nature and properties of this new compound, in the next issue of the PRESS.

LATER.—The telegraph, this morning, brings us the startling and deplorable intelligence that ninety cases of nitro-glycerine exploded at Aspinwall, on the 3d instant, aboard the steamer European, which brought the article from Liverpool. Fifty persons were killed, and the ship and 400 feet of wharf destroyed, including a loss of $1,000,000. The infamous oil was addressed to Bandmann & Neilson, of this city.

THE PARIS EXHIBITION.—Dr. Pigne of this city has been commissioned by the French Minister of Commerce and Public Works to make a collection of mineral specimens belonging to California, for the Museum of the Mining School of Paris. The Doctor invites all persons and especially all mining companies to contribute for this collection any interesting specimens which they may see fit to offer for this purpose. The collection, before being sent to the museum for which it is intended, will be placed on exhibition at the World's Fair, which is to be held at Paris in the summer of 1867. As it will be necessary to send on the collection early in the coming fall, contributors will see the necessity of sending in their specimens with as little delay as possible. A description should accompany each specimen, describing its character, the name of the contributor, the name of the mine, its locality, etc. When the cabinet is put up, this description will be neatly printed on cards to accompany the specimens. If any analysis has been made of a specimen, the result of it is requested with the ore. In all cases, where it is possible, the size of the specimen should not exceed four or five cubic inches. Specimens should be addressed to the care of Dr. Pigne, Dupuytreo, 1,022 Stockton street, San Francisco.

OIL WELL BORING IN SAN FRANCISCO.—Boring still continues at the well on the Potrero. A depth of 280 feet has been reached, and the drill is now passing through blue clay, of a very tough nature. The proprietors are sanguine of striking oil after passing this substance. For the information of the curious in such matters, we give the different stratas already passed through by the drill. The first 160 feet was green shale, resembling soapstone; then sand 18 feet; then green shale with streaks of white and blue clay 80 feet; then sand rock 22 feet; then blue clay, which has recently been struck, and in which they are still boring. The parties at the well assure us that at times the smell of oil is very strong, and that they intend boring, so long as the *smell* continues. We hope that they may be successful and realize their most sanguine expectations. There is no especial geological reason why oil may not be found, in some quantity at least, at the point where this well is being sunk, near the Potrero end of the long bridge.

"INFLUX OF WATER INTO MINES."—Especial attention is called to a letter from Professor Rowlandson, on the above subject, which will be found in another column of the present issue. The matter is one deserving of careful attention. It is quite evident that more care should be taken in conveying the water raised from mines to a safe distance from the mine's surface. We are impressed with the belief that if careful examinations are made a large number of our mining pumps will be found doing much of their duty twice over. We were especially pleased, during a recent visit to the Sneath & Clay mine, in Nevada, now under the management of Mr. S. P. Leads, to observe the care taken by the Superintendent to keep the water of Little Deer Creek from percolating into the mine. The entire Creek, together with a small branch, is taken up and carried over the mine in a wooden conduit. Would it not also be advisable to carry away, in the same manner, the water now received into the drain tunnel? We would again request a careful perusal and consideration of the letter referred to.

MECHANICS' INSTITUTE.—Another large meeting of this association was held last evening, at which the Board of Directors were authorized, by a decisive vote of 117 to 64, to sell the present building and appropriate the funds toward erecting the new Institute buildings on the lot already purchased and graded by the society, on Post street. We presume this action will satisfy the parties who recently obtained the injunction restraining the committee from proceeding with the work, thereby greatly hazarding the common interests of the Institute. The majority vote last evening comprised many of the best members who heartily sustain the new board of officers. The decided majorities shown at the two last meetings in favor of the committee and the board of directors, must convince the disaffected ones that they are unquestionably in the minority, and in our opinion they ought to submit in a good common sense way to the fairly expressed will of the majority.

METALS IN ERUPTIVE ROCKS.—M. Engelbach has discovered in the basalt of Annerod, at Giessen, near the Hartz Mountains in Germany, small quantities of the following very rare metals: Lithium, rubidium, titanium, and vanadium, together with traces of copper, cobalt, lead, tin and chromium. There is much probability that with careful analysis, a trace of most of the metals might be found in nearly or quite all eruptive matter.

MINING MACHINERY.—Capt. Lee, of Grass Valley, we understand, has ordered six Knox amalgamators, of the Golden State Foundry, to be placed in his new mill. Messrs. Dodge & Bro., of this city, have also ordered of the same foundry six of Hendy's Improved Concentrators, for the Benton mill, Bear Valley, Mariposa county. One of these concentrators was also shipped this week for Bigelow Bros., Coney Mill, Amador Co.

COPPER WORKS.—Persons in want of any description of copper or sheet iron work will do well to call upon Mr. M. Reynolds, on Market street, near First. All kinds of cooking stoves tinned or made to order at the same place.

We give below some statistics with regard to the efforts which the Superintendent and Board of Education have been making, within the past few months, to accommodate the children of this city with seats in the Public Schools. It will be seen that a large number of new classes have been formed; and we are assured that no efforts will be spared to provide a seat in the Schools for every child within the legal limits of age, who may do sire such accommodation.

Interesting to Smokers.—Messrs. Gibb & Stahl, at 120 Kearny street, are manufacturing a cigarette of improved construction, so rolled up and adjusted as to be much more easily smoked than those of the ordinary make. A small mouth-piece of stiff paper is attached to each cigarette, while the wrapper of the same is so secured as to preclude the possibility of its losing the "weed" by any unrolling, while in the act of smoking. The tobacco is also of a superior quality, and the cigarettes are much larger than those of the common make. The improvement has been patented. For sale at the cigar stores generally. See advertisement in another column, and inquire for the "Patent Russian Cigarettes."

Ward's Shirts.—The enterprising gentleman who has indissolably attached his name to one of the most indispensable articles of male apparel, has met with such unexpected success as to be compelled to open a second establishment in this city; and Ward's shirts, and all other goods in the gentlemens' furnishing line can now be obtained at the lowest prices, at either 323 Montgomery street, or at the new stand in the elegant block at the corner of Third and Market streets. Persons from a distance who are desirous of securing shirts of Ward's superior make, can obtain printed directions for self measurement, with price list, etc., in addressing a letter as above. See advertisement in another column.

Wm. H. Keith & Co., at Apothecaries' Hall, 521 Montgomery street, advertise in another column some very valuable medical compounds, in addition to their usual large stock of drugs, chemicals, fancy goods, etc. This is one of the oldest and best known drug stores on the Pacific Coast. Physicians and others from the interior ordering goods from them, can always rely upon having their orders filled with the utmost care and promptness.

A Wood Splitting Machine is now in operation on the long bridge, near Grant's stone wharf. The machine is run by steam, and consists of two knives, crossing each other after the manner of a +; the pieces of *wood* being placed upon the center where the knives cross, is split into four pieces by a hammer like a pile driver falling upon it. This appears to be a great improvement on the ordinary method of splitting wood.

A Tight Place.—Messrs. Kittridge & Leavitt have recently constructed a large vault for the Bank of California, seventeen feet in length by five and a half in width, and eight feet high. This vault is secured by a burglar and powder proof lock, which is constructed without a keyhole or any other visible mark by which it is opened. The lock is a new invention, and must be peculiarly discouraging to burglars.

Hon. W. B. Ogden, of Chicago, President of the Northwestern Railroad, who had invested large sums in the Nevada silver mines, has received his first dividend in the shape of a ton of silver in bars, valued at $45,000 to $50,000, based on the present value of greenbacks.

Wire Rope for Mining Purposes.—Wire rope is coming into quite general use for mining purposes. It is found, in practice, to be more convenient, more durable and cheaper than hemp. The establishment of Messrs. Hallidie & Co., for its manufacture in this city, affords mining companies the opportunity to order any kind, size or length of rope which they may need. This establishment has recently received an order from the Savage Company, of Washoe, for a flat hoisting rope, four inches broad by half an inch in thickness, and 750 feet in length. Its cost will be $3,500. This same Company has been using a rope of English manufacture which, although it cost $500 more than what the same size of rope will be furnished for by Messrs. Hallidie & Co., has, nevertheless, proved quite inefficient and much inferior to those manufactured here.

Hoagland & Newsom architects, practical builders and superintendents, office 328 Montgomery street, between Pine and California, room No. 3, up stairs, are ready at all times to furnish plans, specifications, accurate detail drawings and estimates for every description of buildings.

New Agricultural Implements.—We notice among the improved implements for labor-saving, Myers' Patent Hay Elevator or Horse Fork, by which hay or loose grain can be handled with great advantage by horse power, either in the open field or barn. It is made strong, and is said to be easily worked, taking from 500 to 800 pounds at a load to baling or threshing machine. They are manufactured by the Remington Agricultural works, Ilion, N. Y. Agency, 310 Washington street. There are also many improvements in Reapers, Mowers and Threshers, all of which will be of great use to the farmer. We have been shown an improved horse power on an entire new plan, doing away with all large and heavy castings, said to save one-half the power. Should it be as successful here as in New York and the Western States, it will be valuable to farmers, mechanics and miners.—*S. F. Mercantile Gazette.*

Fire-arms.—For the past few months these articles have been in light demand, and prices below home cost. Stocks on hand are not large. There is now a fair trade for mining and other expeditions. Many new styles as well as old are discarded, selling, if at all, for scarcely the cost of raw material. Standard arms long known to the public have slow sale, among which may be named E. Remington & Son's, Colt's, Smith & Wesson's, and Sharp's. Revolvers from six to eight inch barrel, sell from $9 to $12 each. Springfield rifles and like Government arms are in small demand at from $8 to $10 each. Remington & Sons, of Ilion, N. Y., one of the oldest and most prominent arms manufactories in the United States, have an agency at 310 Washington street. We notice a great improvement in their revolvers, the entire frame being composed of a solid piece of metal, rendering it of great strength, and desirable for long use, as the barrel, it is said, cannot get out of line and become worthless.—*S. F. Mercantile Gazette.*

CAUTION.

TO WHOM IT MAY CONCERN:—THE PUBLIC ARE hereby notified that a patent was allowed, December 27th, 1864, and issued June 27th, 1865, to Professor Henry Wurtz, for the use of sodium and amalgams thereof with quicksilver, in the extraction of precious metals from their ores. All persons using said amalgams, or purchasing or selling sodium or said amalgams for use in the treatment of gold or silver ores, are hereby cautioned that they will be prosecuted to the full extent of the law.
The patents of Professor Wurtz have been assigned to the Wurtz Amalgamation Company of New York city. It is the intention of the said company soon to appoint agents for California and the other mining States and Territories. In the meantime, applications for licenses to use sodium and its amalgams, may be addressed to the company, at their office, No. 57 Broadway, New York.
C. ELTON BUCK, Secretary.

GEORGE E. BROWN,
(Late Assistant Examiner in the U. S. Patent Office.)
HAVING RESIGNED THAT POSITION AFTER A TEnure of office of eighteen months, offers his services to
INVENTORS AND THEIR ASSIGNEES,
—AS A—
Patent Solicitor,
He will make Preliminary Examinations in the Patent Office, with a view to ascertain the Patentability of any invention that may be submitted to him for that purpose; will prepare the necessary papers for those who wish to make Applications for
Patents for their Inventions,
—OR FOR—
EXTENSIONS OR REISSUES OF PATENTS
Already granted; will act as an Attorney in presenting Applications at the Patent Office, and in managing them to a final issue; will draw up Assignments; will examine into the condition of Rejected Applications when desired to do so, and undertake the prosecution of such as may be considered patentable, and do whatever else is usually done by Patent Solicitors.
Address, P. O. Box 257, Washington, D.C. 7v12-3m

1852. 1866
A NEW VOLUME.
Fourteenth Year of Publication.
THE GOLDEN ERA.
Founded in 1852.

The oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, The Golden Era is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent, and correspondents and contributors of distinguished ability in New York, Paris and London.

Miss BRADDON'S Greatest Sensation Story published from Advance Sheets:
RUPERT GODWIN;
—OR—
The Secret of Wilmindon Hall.
A NOVEL.
By Miss M. E. Braddon,
Author of "Lady Audley's Secret," "The Outcasts," "The Doctor's Wife," "Three Times Dead," etc.,
—IN—
THE GOLDEN ERA.

NOW IS THE TIME TO SUBSCRIBE!

The Golden Era is now enlarged by the addition of eight columns to its pages—and presents fifty-six columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected Matter, all combining to render The Golden Era a Literary and Family Journal of surpassing interest and attraction; a Welcome Guest in Cottage and Cabin: the favorite at the fireside in City and Country, the most useful, agreeable altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe, and elsewhere. Every Household in the Mountains and Valleys, the Cities, Towns, and Mining Camps of California and throughout the Pacific States and Territories, should receive and welcome The Golden Era as a regular weekly visitor.

Serial Romances in The Golden Era.

The most popular Novels of the present day published as Serials, from week to week, in the Golden Era, from advance sheets, simultaneously with their appearance in the English and Atlantic Periodicals.
Among the contributors to the Golden Era are all the prominent writers of Literary Repute in California and on the Pacific Coast, also correspondents and contributors of distinguished ability in the Atlantic States and Europe, comprising an array of Talent and Genius unapproached by any Literary Journal in California, the Atlantic States, or Europe.

"THOUGHTS AND THINGS"
APPEAR WEEKLY IN THE GOLDEN ERA.
Read "Thoughts and Things" in the Golden Era.
" "Professor Clearquill." in the Golden Era.
" "Dogberry," in the Golden Era.
" "Alice Mason," in the Golden Era.
" "Hugh Humphrey," in the Golden Era.
" "Bill Dadd," in the Golden Era.

TO ADVERTISERS.
Best Advertising Medium.—The Golden Era is the oldest Weekly Journal in California, and indisputably enjoys by far the largest circulation in the city of San Francisco and in the interior of the State.

THE GOLDEN ERA
Is universally read in every city, town, village and mining and agricultural precinct in California, and offers unusual and unequalled advantages to those who desire to bring their business prominently before the community. Only a limited space is devoted to advertising. All advertising pages are also largely occupied with fresh and interesting reading matter, and no advertisement can escape attention. The charges for advertising are not so large, proportioned to the benefits derived, as those of other papers. Liberal terms will be made with those who advertise for three or six months, or by the year.

Metallurgy.

EUROPEAN METALLURGICAL WORKS,

—AND—

Practical Mining School,

Bryant Street, Between Third and Fourth,

SAN FRANCISCO.

THE Proprietors are at all times prepared to work or test Ores sent to this establishment—either in large or small quantities—by such process as may be found best adapted to their chemical character, after a careful analysis has been made. Test lots of Ore adapted to the smelting process attended to. Sulphuret, pyritous, and the (so-called) "rebellious ores," are having especial attention paid to their successful treatment. Assaying in the humid and dry way. Also, refining by cupellation, done at moderate rates.

PRACTICAL MINING SCHOOL.

The proprietors—encouraged by numerous applications from gentlemen desirous of pursuing the study of practical metallurgy—have concluded to admit parties on reasonable terms. Having in their Mill all the necessary appliances for crushing, roasting, amalgamating, smelting, refining and assaying, as also a well extended Laboratory for the analysis of Ores and Minerals, a good opportunity is here offered to acquire a sound practical knowledge of the business.

[Written for the Mining and Scientific Press.]

From Calaveras County.

[BY OUR SPECIAL CORRESPONDENT.]

[Continued from our issue of April 7th.]

Leaving Mokelumne Hill on the following day, I passed through San Andreas, and arrived at night at Calaveritas. This is certainly about as dull a camp as I have ever seen. I found a supper at a French restaurant, kept, however, by Mexicans, and a bed in an old barn of a building, which had once been a hotel, but which was now like

> —"a banquet hall deserted,
> Whose guests were fled, its garlands dead,
> And all but rats departed."

At least if any other living animals besides myself and the above mentioned rodents were its tenants, that night they showed no signs of their presence. At Douglass Flat, where I spent the night of the 16th inst., I found more life and business than at any other point on my trip. The deep placer mining at that place is more prosperous now than at any time within the last year. The lead of gravel is struck at depths ranging from 100 to 200 feet, and varies from six inches to six feet in thickness. It is generally opened by vertical shafts, through which the water is pumped out, and the gravel hoisted by water power. One company, the Dashaway, on the south side of the Flat, and another on the north side, have opened the lead by means of inclined tunnels dipping into the hills, which they consider preferable. I was entertained for the night at the house of Mr. Hitchcock, there being no hotels in the place, a fact which I did not regret, as it was the cause of my forming the acquaintance of a very agreeable family, and passing a pleasant evening.

AT ANGEL'S CAMP

Business is beginning to look up, though there is still great scarcity of money. Several companies are now at work taking out and crushing quartz, but want of space forbids my giving a full description of each. The ledges at this place are very large, and would doubtless pay well, if the rock was rich enough. Eight dollars per ton was the best average that was being obtained by any mills at the time of my visit, while the number of abandoned mills and fixtures lying around told, plainer than words, that more fortunes have been lost here than have been made. Two mills were running at the time of my visit, that of the Stickle Bros. of ten stamps, and that of the Angel Quartz Mining Company of seventeen. Both of these mills are using a machine, the invention of Dr. Hall of Angels, for catching the waste amalgam from the batteries. It is called the "Gleaner," and consists of a shallow pan, conical in shape, lined with amalgamated copper plates, which are so placed that the pulp discharged from the batteries runs directly into it in the center, and as the pan is kept revolving is discharged over the sides. The Superintendent of the Angel's company told me that one-third of the gold saved in his mill was caught in this pan.

Three miles west of Angels is the mine of

THE ALTAVILLE QUARTZ MINING COMPANY.

This mine has been opened to a depth of 140 feet, the lowest working level being 100 feet. At the surface there seems to be three or four small veins running in at north and south directions, and of various widths from a few inches to five or six feet. Some very rich pockets have been found, the rock from which has been worked in arastras. The average yield of that worked under the stamps is set down by the Superintendent at $10 to $15 per ton. The mill is of sixteen stamps and two arastras, and is driven by an overshot wheel, forty-eight feet in diameter, which is also employed to pump the water from the mine, and hoist the ore. While at this mine I was shown a pan of dirt taken from a crevice in the vein a few days before, which contained about $100 in coarse gold. If many such prospects as that are found, the mine is certainly a rich thing.

I arrived at this place on Monday morning, the 19th inst., and have spent my time since then in looking at the copper mines of this neighborhood. I wish, however, in making a notice of them, to include also a description of those in Amador county. The first of these that I visited is that of

THE COSUMNES CEMENT MINING COMPANY,

Located at Copper Hill, about five miles west of Latrobe. The company at first consisted of 100 persons, citizens of Michigan Bar, who located a claim 20,000 feet in length, on a range of croppings running in a northwesterly and southeasterly direction. At Copper Hill the croppings of the lode are probably 100 feet wide. The main shaft is sunk near the west side of the vein, and by a fine chimney of ore about 100 feet in length and from three to four feet wide. The dip of the vein is about forty degrees to the eastward, and that of the chimney some fifteen or twenty degrees north. The ore is a yellow sulphuret full of seams and cracks, and assays from fourteen to twenty per cent. The shaft is 400 feet deep, the lowest working level 370 feet. Another chimney has been opened, some distance southeast from the main shaft, from which a large amount of fine ore has been taken. It is intended to sink another shaft this summer in a central position, and work both chimneys from it. The ore and water are hoisted from the mine by a 25-horse power steam engine with reversible motion, and friction geared reels. The Superintendent, Mr. C. H. West, took great pains to give me information and make my stay agreeable. Near the Consumnes, on a parallel vein is the claim of the Oriental company. They have sunk several shafts, to depths varying from ten to 150 feet, with good prospects, having taken out some very good ore, but from some cause, probably mismanagement, the mine has failed to pay, and has been abandoned, at least for the present.

THE NEWTON COPPER MINE

Is located on the Jackson road, four miles east of Ione City. The claim consists of 1,800 feet on a vein running northwest and southeast, the croppings being visible for a distance of 800 feet, and the vein the most regularly defined of any I have ever seen. The dip of the vein is about thirty degrees east. The vein is opened to a depth of 155 feet, at which depth levels have been run 270 feet north of the shaft and 215 feet south, developing a vein of solid yellow sulphurets of copper from twelve to thirty-four per cent., from two to eight feet in thickness, averaging nearly five feet. There is no sign of "running out" either end of the drifts, and prospects are that the chimney will prove to be of indefinite length. C. T. Meader & Co., purchased a controlling interest in this mine about a year ago, Dr. Newton, the Superintendent retaining his interest of 250 feet, and one other of the former owners reserving thirty-seven feet, the others all selling out. The steam hoisting works were completed about the first of last September, since which time 1,800 tons of ore, from 12 per cent. upwards, have been shipped. No ore has been taken out north of the shaft, and only about one-fourth of that in sight, south of it, leaving between 30,000 and 40,000 tons of No. 1 ore in sight, which may be taken out in a years' time if desired. About 400 tons are now lying in sacks awaiting shipment.

Adjoining the Newton, being an extension southward of the same vein, is the Oak Hill claim. This company have not yet struck the lead, and work has been suspended for some months. I was informed, however, by Mr. C. B. Strong, of Ione, the President of the company, that work would soon be recommenced. On the south extension of this lode, Dr. Randall has struck very good looking ore, and is carrying on his prospecting with energy and good prospects.

Yesterday I spent in exploring the two principal mines of this place, the Union and Keystone, of which, and indeed of all the mines on this coast, the most important is the famous

UNION COPPER MINE.

The vein on which this mine is located lies in a northwest and southeast direction, and dipping to the eastward at an angle of sixteen to twenty degrees, the foot wall being a dyke of serpentine, some twenty or thirty feet wide, and the hanging wall the ordinary slate of the country. The claim consists of 1,950 feet, and has been open for a distance of 800 feet from the northern end. The main shaft is vertical, and has reached a depth of 480 feet, with levels running each way at depths of 72, 106, 150, 200, 250, 300, and 384 feet respectively. A cross is being started for a level at the bottom of the shaft. The shaft cuts the vein at a depth of seventy-two feet, at which point it is eight feet wide, the chimney extending a distance of about 100 feet. From this down to the 250-foot level it steadily increases in width until at that point it is from twenty-five to forty feet, the average of this level and the one next below being about thirty feet. On the two lower levels, the chimney has not yet been struck. As far down as this chimney has been traced, its length is about the same (100 feet), while it dips to the northward, by the measurement of Mr. Pethe-

rick, at an angle of about sixty degrees. At the north end of the main "chute" of ore the vein is divided by a "horse," which extends through this claim and the Keystone, forming two distinct veins. In the north shaft of the Union, the western vein is from four to five feet thick, and the eastern about three, on the lowest level in that shaft, a depth of 170 feet. At the south end of the chimney there is but one narrow vein, which in the south shaft has an average width of three feet, with from twenty to twenty-four inches of concentrated ore. I was told by the Superintendent, Mr. Balch, that nearly 25,000 tons of ore had been shipped during the past year, and he estimates that there are about 50,000 tons more in sight. There are now about 195 men in the employ of the company, nearly half of whom are employed in assorting the ores for shipment, as the low grade ores, being mixed with a large quantity of slate, require to be broken up and selected by hand. The machinery for hoisting and pumping is, as may be expected in such a mine, of the very best. In the main shaft a safety-cage is used, which is the invention of Mr. Wm. N. Shaw, one of the employees of the company, which is one of the most perfect working machines of the kind in use.

THE KEYSTONE

Is an extension of the Union, northward. The claim consists of 3,300 feet. The principal shaft, (called the Houlton shaft) follows the inclination of the vein, and is 360 feet in depth. Levels have been opened at depths of 90, 134, 195 and 275 feet respectively, developing two veins about twenty five feet apart. In the west vein but little copper is found, but in the east vein a chimney is found, varying from one to six feet in width, and about seventy-five feet in length, dipping to the north. The ore assays from fourteen to twenty per cent. Near the bottom of the shaft the dip of the vein is much greater than it is above, and at the bottom the shaft runs some distance into the serpentine, which forms the foot-wall of the vein. Another shaft, 430 feet northwest of the Houlton shaft, and known as the Discovery, is 175 feet deep. Here the conditions are reversed, the west vein being productive, and the eastern one barren. The chute in this shaft appears to be from 80 to 100 feet long, and to average about two feet in width. About 100 feet north of the Discovery shaft, and directly under the old "dressing works," a fine outcrop of gray ore has been struck on the east vein, on which Mr. Sheldon has commenced sinking a shaft. The lode throughout is very irregular in its developments, and the ore is mixed with slate to a very great extent, much of it requiring a large amount of assorting to fit it for market. An attempt was made a short time since to reduce these ores by crushing, and separating by water, after the Welsh method, but the machinery being somewhat imperfect, the work has been suspended for the present, though I was informed by the Superintendent that the last run of the machinery was attended with considerable profit to the company. The ore and water are hoisted from the Houlton shaft in tubs by a 28-horse power engine, while the pump in the Discovery shaft, and the machinery of the reduction works are driven by a fine engine of 60-horse power. Mr. Sheldon seemed to take great pleasure in showing me the works, and treated me with the greatest kindness and courtesy. On the southeast extension of the Union lead, the Empire company are prospecting quite vigorously, but have not yet struck the vein. The Harlem company, two miles west of town, have sunk on their lode to a depth of over 150 feet, and have found some very good ore, though not yet in paying quantities. The rock in their claim is very hard, making prospecting expensive business, but they are not the men to be discouraged. I sincerely hope they may be successful, for if perseverance was ever worthy of success, it certainly is in their case. D.

Copperopolis, March 21, 1866.

Machinists and Foundries.

SAN FRANCISCO

Foundry and Machine Works,

NEW GRINDER AND AMALGAMATOR

HEPBURN & PETERSON'S

AMALGAMATOR AND SEPARATOR,

Tyler's Improved Water Wheel,

Giving the greatest power, at lower cost, than any Wheel in use. There are over 1,500 running, giving universal satisfaction.

KNOX'S AMALGAMATORS,

WITH PALMER'S PATENT STEAM CHEST,

Superior for working either Gold or Silver Ores.

Genuine White Iron Stamp Shoes and Dies

Having been engaged for the past eight years in quartz mining, and being conversant with all the improvements, either in Mining or Milling, we are prepared to furnish, at the shortest notice, the most perfect machinery for reducing ores, or saving either gold or silver. 13v10qy-tf

FULTON

Foundry and Iron Works.

HINCKLEY & CO.,

MANUFACTURERS OF

STEAM ENGINES,

Quartz, Flour and Saw Mills,

Moore's Grinder and Amalgamator, Mining Pumps, Amalgamators, and all kinds of Machinery.

Nos. 45, 47 and 49 First street, between Market and Mission street, San Francisco. 3-qy

Miners' Foundry

—AND—

MACHINE WORKS,

First St., between Howard and Folsom Streets,

SAN FRANCISCO.

EVERY description of Iron and Brass Machinery, the BEST and MOST ECONOMICAL, manufactured in the State of California, will be furnished with dispatch at the MINERS' FOUNDRY AND MACHINE WORKS, such as

Steam Engines and Boilers, Flour, Saw and Quartz Mills,

Machinery, Mining Pumps, Amalgamators,

Retorts, Etc., Etc.

Particular attention will be given to the manufacture of Machinery in Sections designed for places of difficult access. Various models of Quartz Crushers, Amalgamators and Water Wheels—some in operation and on exhibition.

, Parties desiring to test their ores practically, in small quantities, will be afforded ample facilities. FREE OF COST.

All parties desiring accurate and highly finished drawings and superior Machinery, at most reasonable rates, are cordially invited to call before contracting elsewhere.

HOWLAND, ANGEL & KING.

UNION IRON WORKS,

Sacramento.

WILLIAMS, HEILBRON & CO.,

MANUFACTURERS OF

STEAM ENGINES, BOILERS,

And all kinds of Mining Machinery.

Also, Hay and Wine Presses made and repaired with neatness, durability and dispatch.

Dunbar's Patent Self-Adjusting Steam Piston PACKING, for new and old Cylinders, manufactured to order.

Front Street, between N and O streets,

14v11 SACRAMENTO CITY

PORTLAND BOILER WORKS.

MOYNIHAN & AITKEN,

Boiler Makers and Sheet Iron Workers,

N. B.—All kinds of Boiler and Sheet Iron Work executed at the shortest notice, and on the most reasonable terms.

Mission street, between Beale and Fremont streets, San Francisco. 10-v12

JOHN LOCHHEAD'S

STEAM ENGINE WORKS,

Beale Street, near Mission Street,

ap14 C. HEYWOOD, Secretary.

Lady Franklin Gold and Silver Mining Company, Silver Mountain District, Alpine County, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 31st day of March 1866, an assessment of twenty-five cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, 305 Montgomery street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the 7th day of May, 1866, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the 5th day of June, 1866, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. S. LUTY, Secretary,

Office, 305 Montgomery street, San Francisco, Cal. ap6

Madison Gold and Silver Mining Company, Lander County, Nevada.

NOTICE.—There are delinquent upon the following described stock, on account of assessment levied on the 14th day of March, 1866, the several amounts set opposite the names of the respective shareholders, as follows:

SUBSCRIBE FOR IT.—The large, illustrated sixty four column weekly newspaper—the San Francisco MINING AND SCIENTIFIC PRESS—should be taken by every miner, prospector, and intelligent citizen throughout Colorado, as it gives a mint of most useful information to be gained no other way, on mining matters generally.—[Rocky Mountain News.

THE EXCELSIOR
GRINDER AND AMALGAMATOR.

In the engraving herewith presented, A represents the Rim of the Pan; B, Muller; C, Legs; D, Cross-Frame; E, Gearing; F, Screw; G, Lover; H, Dash-Boards; I, Key; *a*, Dies; *c*, Shoes, and *o*, Openings,

The relative grinding capacities of "The Excelsior" Grinder and Amalgamator, of the Flat Bottomed Pan, and of the Conical Pan *when properly constructed*, are respectively 177, 98 and 110.

That is, the respective mullers being of the same diameter, same weight, same hardness, and running at the same veloeity "The Excelsior Grinder and Amalgamator" will reduce one hundred and seventy-seven tons of ore, the Flat Bottomed Pan ninety-eight tons, and the Conical Pan one hundred and ten tons to the same degree of fineness in the same time.

The wear to the Shoes and Dies at their grinding surfaces in the Excelsior Grinder and Amalgamator, is perfectly uniform, thus securing evenness of reduetion to the pulp, as well as steadiness of motion to the muller. Uniform wear of the grinding plates has been attained in no other than that of the Tractory form—nor can it be.

Another property of excellence in this machine is that the metal or substance to be amalgamated passes *direct* from the grinding surfaces into the quicksilver; thus excluding the possibility of its becoming coated with any foreign substances, after having been furnished. It is truthfully said "that the Tractory-formed Pan as a Grinder has no equal, and as an Amalgamator no superior."

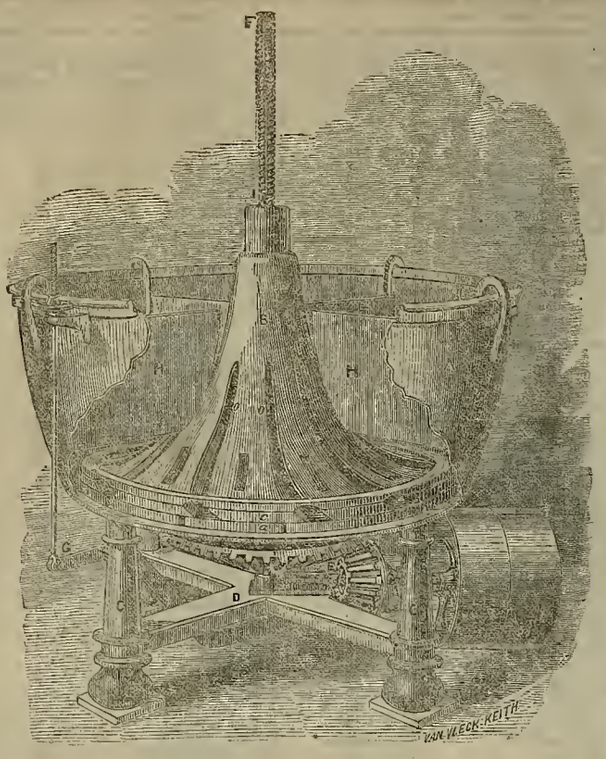
As a whole, it is far superior to any other pan in use.

MANUFACTURED AT THE

Union Iron Works and Golden State Iron Works,

WHEELER & RANDALL, Inventors.

The nndersigned having had several years of experience in practical quartz mining operations, will ever take great pleasure in furnishing parties interested in mining and machinery any desired information which they may possess.



Machinery.

"Safety Cages."

(PATENT GRANTED.)

MINING COMPANIES

WILL FIND IT TO THEIR INTEREST TO ADOPT "Berry, Hochholzer & Denver's Safety Cage" in their hoisting works. It requires very little more work to manufacture than the ordinary style of cages—any blacksmith can make it. It has been PROVED TO BE PERFECTLY SAFE, is self acting and very light, and will, in the item of rope alone, pay for itself in a short time.

The proprietors refer to the following mining companies, among others, that are now using this Safety Cage:—Gould & Curry, Savage, Ophir, Mexican, Empire, Overman and Justis.

For particulars and terms, apply to

HUGO HOCHHOLZER,

Virginia City, Nevada,

15v11tf Through Wells, Fargo & Co's Express.

Union Amalgamator.

This Valuable Invention

IS FAST FINDING ITS WAY INTO GENERAL USE, NOT by means of combination of capital and influence, but on the strength of its own merits, and upon the principle that what is known to be good will be appreciated. Practical men acknowledge the UNION PAN to be scientific, the best, the cheapest, and most profitable. It now stands first on the list of all pans in use for the purpose of

Working Gold and Silver Ores.

It has been found that a low class of ores, also tailings from Mills, Sulphurets, etc., that will not pay to work with the common pans, may be worked with this and obtain large profits. The UNION PAN is manufactured in two sizes, and capable of operating upon large quantities of ore in the most efficient manner.

Parties interested in Quartz Mining, Mills, etc., will find it to their advantage to call and examine for themselves, and see its operation.

Gold and silver ores tested by regular mill process, at moderate cost, by

STRONG & CO.,

San Francisco Foundry, corner Mission and Fremont streets, where orders will receive prompt attention.

EXCELSIOR DOUBLE ACTING
Suction and Force Pump.

W. D. Hooker's Patent, August 15, 1865.

THE SUBSCRIBERS OFFER FOR SALE the following sizes of the above-named celebrated Pump, acknowledged to be the best Double Acting Pump known to be in use. They are more easily set in position, and are more durable and compact than any other Double Acting Force Pump; they are also worked with very little friction, and have greater forcing power than other pumps of like size. They are adapted to work by hand, wind-mill, horse, or steam-power.

No. 1—Cylinder 2½ in., stroke 6 in.
No. 2—Cylinder 3 in., stroke 7 in.
No. 3—Cylinder 4 in., stroke 10 in.
No. 4—Cylinder 5 in., stroke 15 in.
No. 5—Cylinder 6 in., stroke 18 in.

The Nos. 4 and 5 are Mining Pumps.

We have also for sale a full assortment of Pump Fixtures, such as Iron Pipe, Hose, Brass Goods, etc.

10-v12 San Francisco, Cal.

VARNEY'S
PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setters made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setters for themselves, at the **PACIFIC FOUNDRY,**

Our Circulation.—The Mining and Scientific Press has a large and permanent subscription list, and enjoys a more universal circulation among stockholders and persons directly interested in mining than any other paper on this coast.

Twelfth Volume.—The Mining and Scientific Press, published at San Francisco, commenced its twelfth volume on the 6th inst.—[Nye County News.

Of the Term "Printer's Devil."—When Aldus Manutius set up in business as a printer in Venice, he came in possession of a little negro boy. The boy was known over the city as the "little black devil," who assisted the mysterious hiblofacter; and some of the most ignorant believed him to be none other than the embodiment of Satan, who helped Aldus in the prosecution of his profession. One day Manutius, desiring to dispel this strange hallucination by publicity, displayed the young "imp" to the poorer classes. Upon this occasion he made this short but characteristic speech: "Be it known to Venice, that I, Aldus Manutius, printer to the Holy Church and Doge, have this day made public exposure of the printer's devil! All those who think he is not flesh and blood may come and *pinch* him."

The Word "News."—Some lover of the curious in literature asserts that the word "news" is not derived from the adjective "new," as many suppose. He says that in former times it was common to see on the newspapers of the day the initial letters of the cardinal points of the compass, thus:

N.
W. —— E.
S.

These letters were intended to indicate that the paper contained intelligence from the four quarters of the globe; but they finally came to assume the form of "news," from which the term "newspaper" is derived. How remarkable is the power of that invention, which, by the aid of the telegraph, brings daily in small compass of the newspaper, news from all parts of the globe.

The Sponge Divers of Calymnos.—Mr. C. T. Newton, in his "Travels and discoveries in the Levant," says: "The island of Calymnos is celebrated for its sponge-divers, who sail in a fleet of caiques for the coast of Asia Minor and Syria, during the month of May, and fish up annually £16,000 worth of that valuable substance. The diver descends holding a flat stone in both hands, to assist him in sinking, on which stone a cord is fastened. When he gets to the bottom he puts this flat stone under his arm and walks about in search of sponges, putting them in a net around his neck as fast as he uproots them; he then pulls the cord as a signal, and is drawn up again. It is said that the best divers can descend to a depth of thirty fathoms, and that they can remain under water for as long a period as three minutes. From inquiries which I have made, it does not appear that they are often cut off by sharks, though these monsters are not unfrequent in the southern part of the archipelago. It is possible that the rapid descent of the diver may scare away this fish, who generally seizes his prey on the surface. A Calymniote told me that the most terrible sensation he had ever experienced was on finding himself close to an immense fish at the bottom of the sea. Under the roots of the sponge is a parasitical substance of a caustic nature. This often bursts when the sponge is suspended round the diver's neck, and the liquid it contains causes deep ulcers in his flesh."

Influence of Newspaper Reading on the Minds of Both Sexes.—We have found it to be the universal fact, without exception, that those scholars of both sexes who have access to newspapers at home, when compared to those who have not, are:

1. Better readers, excellent in pronunciation, and consequently read more understandingly.

2. They are better spellers, and define words with ease and accuracy.

3. They obtain practical knowledge of geography in about half the time that it requires others, as the newspapers have made them acquainted with the location of important places, nations, their governments and doings, on the globe.

4. They are better grammarians, for, having become so familiar with every variety of style in the newspaper, from the common-place advertisement to the finished and classical oration of the statesman, they more readily comprehend the meaning of the text, and consequently analyze its construction with accuracy.

5. They write better compositions, using better language and more connectedly expressed.

6. Those young men who have been readers of the newspapers are always taking the lead in the debating societies, exhibiting a more extensive knowledge upon a greater variety of subjects, and expressing their views with greater fluency, clearness, and correctness in the use of language.

Dr. Abernethy used to tell his pupils that all human diseases sprang from two causes—stuffing and fretting.

KEEPSAKES.—Let us say a word u on such remembrances as lockets, love-gifts and keepsakes. From the crooked sixpence which Mary, the maid-of-all-work, hoards jealously up in her box, because John the footman gave it to her—from the humble testimony of love to the glittering bauble that decks the fingers of her young mistress, we admire and prize them all. A keep-sake, like mercy, is "twice blessed —it blesseth him that gives and him that takes." No heart can be so dead to the best feelings of humanity as not to throb with some little emotion when the eye is gazing in solace and secret on the last relic of one we dearly loved. It hallows the mind and purifies the heart, and we have a saving faith, too, that it absolutely betters their morals. No very atrocious deed could be committed when the present of one we esteemed and respected was near to us to check every action. A locket, containing the hair of one no longer living, is a melancholy, but yet a gratifying memorial It is a kind of pledge given to those on earth in anticipation of a blessed union hereafter. The hair, too, is the last thing that decays, and is, therefore, the most appropriate relic of the dead. We never behold a locket suspended amongst the glittering jewelry of a pawnbroker's without being led into a train of most sombre reflections. What a struggle between life and death must that have been that induced the possessor to relinquish this last token to satisfy the cravings of hunger. It is too painful a theme to dwell upon long. The heart sickens at the sight of things, the very possession of which speaks of former o, ule ce and present poverty—of a once happy home, now deserted. These glittering memorials of love, these sacred offerings of friendship, are here exhibited like the bony integuments piled up in the Parisian catacombs, as part and parcel of the virtually dead.

LADY SUBSCRIBERS.—The editor of a Boston weekly paper pays a high and well deserved compliment to the fair patrons of the press. 'Women,' he says, 'are the best subscribers in the world to newspapers, magazines, etc. We have been an editor now going on forty-eight years, and we have yet never lost a single dollar by female subscribers. They seem to make it a point of conscientious duty to pay the preacher and the printer—two classes of the community that suffer more from bad pay, and no pay at all, than all the rest put together. Whenever we have a woman's name on our book, we know it is just as good for two dollars as a picayune is for a ginger cake.'

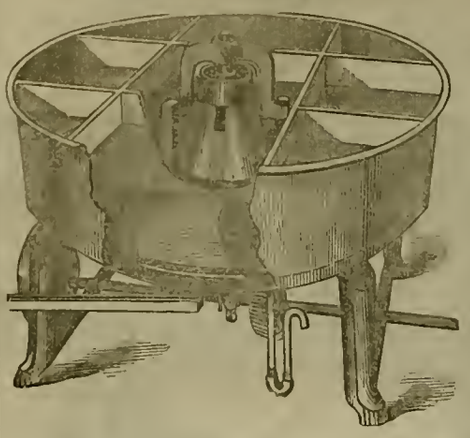
NATURAL HISTORY FOR THE YOUNG.—For many years it has been one of my constant regrets that no school-master of mine had a knowledge of natural history, so far, at least, as to have taught me the grasses that grow by the wayside, and the little winged and wingless neighbors that are continually meeting me with a salutation which I cannot answer as things are Why didn't somebody teach me the constellations, too, and make me at home in the starry heavens, which are always overhead, and which I don't half know to this day? I love to prophesy that there will come a time, when not in Edinburgh only, but in all Scottish and European towns and villages, the school-master will be strictly required to possess these two capabilities (neither Greek nor Latin more strict!) and that no ingenious little denizen of this universe be thenceforward debarred from his right of liberty in these two departments, and doomed to look upon them as if across grated fences all his life.—*Thomas Carlysle.*

NEST OF THE HUMMING BIRD.—The nest of the humming bird is a miracle of perfection in domestic economy. For beauty, fitness and safety, the wisdom and taste displayed in its arrangement are irreproachable. Bedecked in plumage of emerald, ruby and topaz, remarkable for the delicacy of its form and grace of its motion, unsullied by rain from the clouds or dust from the earth, feeding upon the nectar of the flowers, its habitation should be in character, and so it is. Shaped like a half cup, it is delicately formed of lichens, colored like the branch on which it is fixed, and lined with the soft down of plant blossoms, of mullen leaves, or the young fern. It is delicately soft, sheltered, and is indistinguishable from the bark of the tree, of which it seems a most natural excrescence—a moss-grown knot. Two white eggs as large as peas adorn the nest, upon which, as asserted by some naturalists, the cock and hen sit by turns for ten or twelve days. The little birds, scarcely larger than flies, enter upon their existence in a chamber tapestried as with velvet, and are fed with the sweets of flowers from the maternal tongue. The tiny household exhibits not only a commendable neatness but exquisite taste and delicacy in all its arrangements. Can gentle humanity derive no lesson from such an example?

AT the mines of Traversalla, in Savoy, magnets revolving on a wheel are used to pick up the powdered ore, leaving the copper pyrites behind.

Knox's Improved Patent Amalgamator and Separator,

With Palmer's Patent Steam Chamber or Die.



THIS CUT REPRESENTS AN AMALgamator and Separator that has stood the test of many years' practical working in the gold mines of California, and for nearly the same time in the silver mines of Nevada, having been introduced into the first steam mills built in the then Territory, since which time they have been successfully working against all competition.

The great advantages these Amalgamators have over any others, are—

1st. **Much less Cost.**

2d. They do not "flour" the mercury, and collect any that may have been "sickened" in the battery or grinders.

3d. The "slushing" motion given to the pulp (by the revolution of the muller under the stationary frame) against the amalgamated copper plates that are fastened to the frame, and by this means catching the fine gold and mercury that will not settle.

4th. The gate in the cone, through which the pulp is discharged, from the top, and where there is the least motion, almost precluding the possibility of any granulated mercury or fine gold escaping.

There are over 500 of them in use in California and Nevada, where those interested can see their practical workings.

☞ For further particulars, inquire of ISRAEL W. KNOX, on W. A. PALMER, Inventors,

Portable Steam Engines!

"Hoadley's" and "Hittinger's" Make,

COMBINING THE MAXIMUM OF EFFICIENCY, Durability, and Economy, with the Minimum of weight and Price.

These Engines are favorably known, a large number being in use on this coast for hoisting, pumping, threshing, milling and mining purposes.

Steam can be got up on these Engines in fifteen minutes after reaching the place of operation, and the time, expense of setting boilers, machinery, and "construction account" saved, (which is often the difference between the successful and unsuccessful prosecution of milling enterprises,) in fact, the portable principle is the pioneer's friend, and enables him to draw engines on their own wheels to his cabin door, and plant on the outermost confines of civilization the saw and grist mill, and it has done and will do more to help subdue the continent than any other of the modern motors which are crowding society and nomadizing the world.

All sizes on hand from 3 to 30 horse power, with and without carriages.

Also, Portable Saw and Grist Mills.

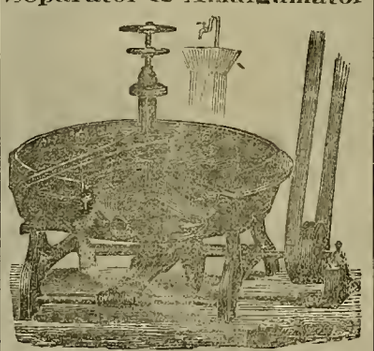
For sale by TREADWELL & CO.,

3v12-3m Corner of Front and Market streets.

THE PRESS is a large, sixteen page paper, and is truly a valuable assistant to the mining interests of the Pacific Coast.—[Nye County News.

BAUX & GUIOD S

Separator & Amalgamator



Is the most important improvement in mining machinery ever introduced. It was awarded the FIRST PREMIUM at the San Francisco Mechanics' Fair for 1864, where it proved itself to be the best Separator and Amalgamator among all the competitors. Constructed on principles which combine SCIENTIFIC KNOWLEDGE WITH PRACTICAL EXPERIENCE, these Pans extract more gold and silver from their ores than any others in use, as a few hours trial will demonstrate Mill men will find it to their advantage to employ these pans as Separators, in addition to the ordinary Amalgators now in use, and to re-work their old tailings.

The cost of these pans is inconsiderable, and their structure is such that they can be readily separated in parts convenient for packing on mules. Among the many advantages possessed by BAUX & GUIOD'S Pan, are the following: The trifling cost for attendance; Its small cost; Its portability; The large quantity of pulp it can operate upon in a given time; It may be worked even weeks without stopping as it is constructed to work continuously; The complete thoroughness of the separation of the rock from the metals and the trifling power required to work them; They can be attached to any ordinary crushing apparatus.

We have the pleasure of referring parties interested to the following parties, who have our Pan in use: Jeffersonian Mining Company, Bowman's Ranch, Nevada county; The French Mill, Nevada City; Crall's Gravel Cement Works, Nevada county; Wahman's Chlorination Works, Nevada, Cal.; Gold Hill Quartz Mill, Washoe.

Manufactured at the Vulcan Iron Works and San Francisco Foundry, San Francisco, and at Hough & Thom's Foundry, Nevada City.

For further particulars, or to see this Pan in operation, call on or address J. B. BAUX,

Fremont Street, near Mission, adjoining the San Francisco Iron Works, San Francisco. 4v6-ddf

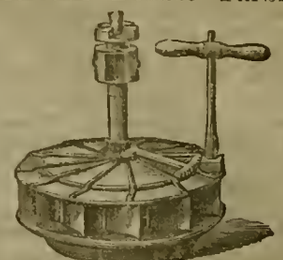
LEFFEL'S

American Double Turbine



THIS WHEEL, WHICH HAS HAD THE most unprecedented sale of any water wheel ever made, and which has given unusual satisfaction wherever used, is now for sale by KNAPP & GRANT, 310 Washington street, San Francisco, where persons desiring to use water-power can be supplied. These Wheels are adapted to use from 10 to 5,000 inches of water, and from 4 feet to 300 feet fall Let us know how much water you have either in miner's inches or cubic feet per minute, what fall you have, and what power you require Write or send for circular to KNAPP & GRANT,

—ALSO— San Francisco.

Leffel's Lever Jacks,

For railroads, cars, or wagons; Railroad Jacks for engines and cars; Track Jacks for leveling, with which three men, with a pair of these Jacks, can level more track in a day than twelve men working in the ordinary manner; also, Track Jacks for relieving the axle of pressure to replace the brass. These Jacks are now in general use in the Eastern States, and give entire satisfaction. Also, Wagon and Track Jacks of the most superior make and kind. For sale by KNAPP & GRANT,

12v12-3m San Francisco,

HUNTER'S

PREMIUM

CONCENTRATOR, AMALGAMATOR

AND SEPARATOR,

Awarded a Silver Medal at the late Mechanics' Fair.

HUNTER'S CONCENTRATOR CAN BE SEEN IN OPERation daily at the Novelty Iron Works, Fremont street. Parties wishing to purchase Concentrators will find it to their advantage to examine the above machine before purchasing elsewhere, for the following reasons:

1st. It will work the sands from a 5-stamp battery, and save from 10 to 20 per cent. more sulphurets than any machine built on the Pacific coast.

2d. The Sulphurets are washed clean, containing less than ten per cent. of sand.

3d. The waste free gold and amalgam is amalgamated on the copper plates; no trace of ground mercury and scarcely a trace of metal passes off with the sand.

4th. Its simplicity is a sufficient recommendation for its general use as a Concentrator. The variation of speed in a Quartz Mill does not effect the working of the Machine. The same was demonstrated at the late Mechanics' Fair, when with the greatest IRREGULARITY OF SPEED the best of results were given.

5th. There is no clogging or stopping to clean out the sulphurets and sand; consequently no waste from any inattention on the part of the attendant.

6th. In exhibiting the working of the machine (it is not run empty), all classes of ores and tailings, from 50 pounds and upwards, are concentrated that parties may see fit to test the machine with.

Give it a trial, and satisfaction is guaranteed. All orders and any information required, address,

ANDREW HUNTER,

Novelty Iron Works, Fremont st., San Francisco,

15v12-3m Or to E. T. STEEN, Agent.

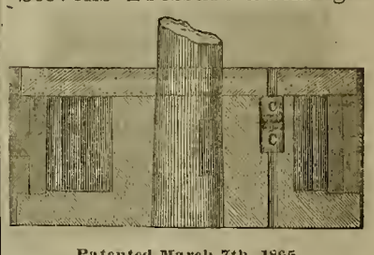
26v11tf 311 and 313 California street.

Stevens' Pressure Packing.



Patented March 7th, 1865.

Pressure Packing is now conceded, by the best engineers, to be the most effectual method of making and keeping the metallic ring of pistons steam-tight.

STEVENS' PACKING has the advantage of being cheaper in first cost than the ordinary packing, and can be applied to old style pistons with very little alteration or detention. In place of testimonials, the Patentee requests of those who are using the old spring packing to inquire of the owners of the various engines which now have this packing in use—some of which have been running from three to twelve months without being opened, or showing any descriptive leak—and act upon their recommendation.

Further particulars can be had by applying to the Patentee, ANDREW STEVENS, Master Mechanic, Alameda Railroad, or at the VULCAN IRON WORKS, where they an be seen, or at any time, in course of construction.

TRY IT 50 PER CENT SAVED BY USING

STANDARD SOAP COMPANY'S WASHING POWDER,

THIS POWDER IS SUPERIOR TO ALL OTHER PREparations for washing and cleansing. It is made of pure material, and contains nothing that will injure the finest fabric. Equally as good for using in hard as soft water. One pound will make three gallons of beautiful soft soap. Put up in wrappers of 1-lb each, and in wooden boxes of 10 lbs bulk. Ask your grocer for a package, and test its virtue. Manufactured at **207 Commercial street,** San Francisco. 15v12q

Pacific Mail Steamship Co's THROUGH LINE TO NEW YORK,

Carrying the United States Mail.

LEAVE FOLSOM STREET WHARF, AT 11 o'clock A. M. of the following dates, for PANAMA, connecting via Panama Railroad, with one of the Company's splendid steamers from ASPINWALL for NEW YORK.

On the **10th, 18th** and **30th** of each month that has **30** days.

On the **10th, 19th** and **30th** of each month that has **31** days

When the 10th, 19th and 30th fall on Sunday, they will leave on Saturday preceding; when the 18th falls on Sunday, they will leave on Monday following.

Steamer leaving San Francisco on the 10th touches at Manzanillo. All touch at Acapulco.

Departures of 18th or 19th connect with French Trans-Atlantic Co.'s steamer for St. Nazaire, and English steamer for South America.

Departure of 10th connects with English steamer for Southampton, and P. R. R. Co.'s steamer for Central America.

Departure of the 30th connects with English steamer for Tumaco, the port of the new mines.

The following Steamships will be dispatched on dates as given below:

30th—GOLDEN AGE.....Capt. E S. Farnsworth.
Connecting with ARIZONA, Capt. Maury.

Cabin passengers berthed through Baggage checked through—100 pounds allowed each adult.

An experienced Surgeon on board. Medicine and attendance free.

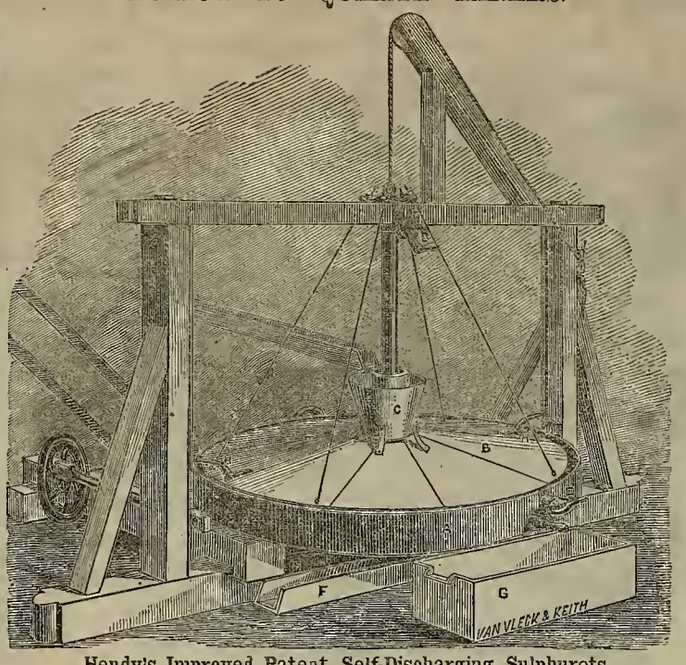
These steamers will positively sail at 11 o'clock. Passengers are requested to have their baggage on board before 10 o'clock.

For Merchandise and Freight apply to Messrs. WELLS, FARGO & CO.

For passage and all other information, apply at the Pacific Mail Steamship Co's office, corner of Sacramento and Leidesdorff streets.

OLIVER ELDRIDGE, Agent.

NOTICE TO QUARTZ MINERS.



Hendy's Improved Patent Self-Discharging Sulphurets

PRATER CONCENTRATOR

Is Receiving Universal Favor.

Reference is made to the following Mills which are using the Prater Concentrator, with some of the improvements attached. The Self-Discharging Sulphurets has been more recently adapted, and the public attention is called to examine its workings:

STEPHENS' MILL, Humboldt County, Nevada.
CHRYSOPOLIS MILL, " " "
U. S. REESE RIVER MILL, Austin, "
UNION MILL, El Dorado County, near Mud Springs.
NEW YORK AND EL DORADO CO., " "
CONEY MILL, Jackson, Amador County.
Messrs. TUBBS & CO'S MILL, San Andreas, Amador Co.
WINTER'S MILL, Angels Camp, Calaveras County.
CLIO MILL, Jacksonville, Tuolumne County.
CARROL & ASPINWALL MILL, Reese River, Nevada.

And in use in other parts of this State; also in Idaho, Arizona, Colorado and Mexico.

As a further evidence of its worth, orders have been received recently from the proprietors of the following mills, all of whom are using these Concentrators, or have works in the immediate neighborhood of mills using them, viz.:

One Concentrator ordered for the Coney Mill, Jackson, Amador County, by Messrs. Bigelow & Bro., of this city.
Three Concentrators for the Spring Hill Mill, Volcano, Amador County.
Two Concentrators for the Golden Gate Mill, Volcano, Amador County.
Four Concentrators for the Raw Hide Ranch Mill, Sonora, Tuolumne County.
Six Concentrators for the Benton Mill, Bear Valley, Mariposa Co; ordered by Messrs Dodge & Bro, San Francisco.

They may be seen in operation at the GOLDEN STATE FOUNDRY, No. 10 First Street, San Francisco.

THE AMERICAN FLAG.—The facts as to the origin of the American Flag, are simply these: A number of flags had been used previous to the Declaration of Independence, none of which could be called *national*. On the 14th of June, 1777, Congress ordered "that the flag of the thirteen united States be thirteen stripes, alternate red and white; that the union be thirteen stars, white in a blue field, representing a new constellation." The idea is supposed to have been suggested by John Adams, who was then chairman of the board of war; and it is believed that he took the idea from the arms of the Washington family, the shield of which represents a white field traversed by two red bars, with three spur rowels or stars in the upper portion. The resolution of June 14th was not made public until September 3d, 1777, and the stars and stripes were first displayed conspicuously at the surrender of Burgoyne, in October of the same year. No attempt was made to alter the flag until 1794, when it was resolved by Congress that there should be fifteen stripes and fifteen stars in it. The addition of a star and a stripe for each new State was found to be exceedingly inconvenient, as it would soon enlarge the flag to ridiculous proportions. In 1817, Captain Reid, of the navy, who had commanded the famous privateer General Armstrong, suggested that the thirteen stripes be retained in commemoration of the thirteen original colonies, and that a new star be added to the cluster in the union on the Fourth of July next succeeding the admission of any new State. The suggestion was adopted by Congress, and on April 4, 1818, became a law. The first flag under this law was made by the wife of Captain Reid. This lady died in Baltimore, Md., about the year 1857.

PAHRANAGAT.—The Reese River *Reveille* of April 3d, has the following:

Another View.—As everything in relation to Pahranagat is now of special interest to our readers, we give below the summary of a letter written to us by Joseph Todd. He is well known both in this State and in California, and his statements will be readily believed. Under date of March 21st, Todd writes: "I will give you my opinion of this country by saying that we are beautifully bilked. There is not a mine here that I would have as a gift. The mineral is principally antimony, galena and copper, with very little silver. You remember a piece of ore that was shown to us and others in Austin as coming from this district; well, I am now satisfied that it came from the Gould & Curry mine."

TEACHER'S PARTY.—The use of Lincoln Hall has been granted by the Board of Education to the teachers of the Lincoln School, to hold a party for the teachers of the Department and their friends, on the evening of May first. A pleasant time will doubtless be enjoyed on that occasion, by such as are so happy as to be numbered among the teachers of San Francisco, or who may be enrolled on their list of friends.

THE BIG VAULT manufactured by Messrs. Kittredge & Leavitt, and mentioned in our last issue, was made to the order of the Bank of British Columbia.

STATE BOTANIST.

Under the above caption several of our contemporaries have announced that our fellow citizen, Mr. H. N. Bolander, has recently been appointed Botanist to the State Geological Survey, whose duties, it is further stated, will commence with the examination of that hitherto almost unexplored district north and west of Clear Lake, to the Pacific; after the completion of which, his labors will be devoted to researches in Alpine country. The selection by the survey of the individual named, as well as the localities are equally excellent, and we may anticipate from the researches of Mr. Bolander, a description highly interesting, not only to those connected with California, but to science generally, combined with such deductions of an economic character as the observations made will justify.

The last idea induces us to throw out a suggestion that the next Legislature will do well to consider the propriety of appointing Mr. Bolander, to a certain extent, at least, an independent State Botanist. Our reasons for making the suggestion are because Mr. Bolander, in addition to the great and acknowledged ability which he possesses as a scientific and technical botanist, is one of those few, but when found most valuable scientific characters, in an economic point of view, who to an ardent attachment and pursuit of their favorite study never neglect, when an opportunity occurs, of pointing out where any scientific discoveries or observations can be made available to improve the condition of agriculture, and thus furnish additional stores for the enjoyment and blessings of life.

This climate, so peculiar in its character, and so variable in its seasons from the extreme of aridity to seasons of great rain, render the services of such a gentleman of the utmost economic value. A practical report from such an experienced botanist as Mr. Bolander on our indigenous grasses and clovers, for which latter California possesses a great variety, and their adaptation to different soils and climates, as well as the introduction of new species and varieties calculated for our special requirements, would be a boon of almost inestimable value, and should have a general circulation throughout the State, independent of the Geological Survey. By such means our farmers would at once obtain access to the accumulated observations of scientific men of various countries and ages in such a popular form as to be available to the humblest capacity. A report of the kind noticed, written in a popular form, would be calculated to advance our agriculture many years, and save large sums in the aggregate, which would probably be otherwise expended from time to time in individual trials; it would also greatly accelerate the acquirement of knowledge which, without the assistance of such information, would probably be obtained only at the expense of the losses occasioned by repeatedly dear bought experience. We have the utmost faith that when the labors of Mr. Bolander are given to the world, they will not only prove creditable to himself, but also reflect honor upon the State which has employed him. He has already entered upon his labors in the vicinity of Clear Lake.

REESE RIVER ORES.

The recent discussion which took place in this journal respecting Reese River ores, induced a gentleman to wait upon us for the purpose of inquiring into the real merits of the controversy. The applicant alluded to was referred, as the best information we could afford, to the table which appeared in the MINING AND SCIENTIFIC PRESS of the 3d February last, as respects the quality of the ores crushed at Reese River. This information did not appear satisfactory to the applicant, as he stated that the returns made by working with the pan process, would not be any criterion of the actual value of the ore attempted to be reduced. He described two species of ores found in the vicinity of Austin, one of which may be termed a strict antimonial ore; the other as very quartzose, intermixed with sulphurets, consisting of sulphurets of antimony, lead, zinc, silver and occasionally copper. Of these ores the party stated he had received information of a quite opposite character, as to the quantity obtainable; one party asserting that twenty tons per week could not be obtained in that vicinity, averaging $70 per ton; the other asserting that the quantity obtainable would keep 200 stamps at constant work. Which is correct? If sufficient ores of a class that would *assay* $75 per ton could be obtained to constantly maintain a small mill at work, we understand it is probable that, if encouragement were given, some parties in San Francisco would venture on a trial. What say our friends at Austin about this? What patronage would be afforded to such an enterprise?

Since the above was in type, we have been informed that it is under contemplation, by certain parties in this city, to send a competent person to Reese River to report on the conflicting statements made; and that, if the report of the party should prove favorable, to form a company, having for its object the development of the mineral resources of that district. As the party may leave here before our next publication, we would advise those interested in the matter at Austin, to be on hand and ready with all needed information.

We devote a large space in our columns today to the reply of Mr. Randall to Mr. Goodyear's review of Randall's first discussion of the "Grinding Effects of Differently Formed Plates." We have given the reply entire, in one number, in order that the matter may be transferred to book form. It will be our aim hereafter to guard as far as possible against lengthy discussions on any subject whatever.

A LIBRARY FOR THE DENMAN SCHOOL.—The use of Lincoln Hall has been granted for the purpose of holding an exhibition at the close of the present term, the proceeds of which are to be applied to purchasing a library for the Denman School. The friends of the Denman and all the other Schools should turn out on that occasion and give the "Denman girls" a right generous lift in aid of the good cause which they have undertaken. More particular notice will be given of the proposed exhibition when the arrangements for the same are fully completed.

NEW GRANADA.—A letter of date March 26th, from a Barbacoas miner to a friend in Virginia city, Nevada, speaks of those mines as the greatest "sell" of the day. Three days from Panama to Tumaco—500 miles—by the English steamer; three days at that place,—then off for the mines. Twenty miles by sea, and one hundred miles on the river in a canoe,—eight days. Mosquitoes intolerable. Two weeks work for the party of ten men, seventy-five cents. One mine, worked by a man named O'Connor, is the only one which "pays." The party were glad to get back to Panama. Forty men,—old miners,—"dead broke," came up at the same time.

A letter dated Panama, March 15th, says that twenty men of Joe Nelson's party from Virginia city and Gold Hill, Nevada, were drowned in the Checo river. Nelson was among the saved.

The U. S. Consul at Panama has visited the mines, and publishes the following card in the Panama *Herald*:

Consulate of the United States, Panama, March 28th, 1866. Messrs. Editors *Star and Herald*—Gentlemen: I fully approve the views expressed in your paper of the 27th instant, in regard to the emigration of poor miners to Barbacoas. Great suffering already exists at the mines, and my advice to all miners in California and Nevada is, do not come unless you have at least five hundred dollars in your pockets above the expense of getting to the mines, as a capital to start with, or as means of returning if sick or dissatisfied. I am very respectfully your obedient servant,

W. B. LITTLE,
United States Consul.

CEMENT MINING IN YUBA COUNTY.—A late correspondent of the Marysville *Appeal*, writing from Smartsville, under date of April 20th, gives a description of the "Blue Gravel" claims, now becoming famous, and he indulges in some speculations in regard to the origin of the formation in which it is situated.

We quote a few lines: "The appearance of the country—the nature of the gravel beds; petrifactious; conglomerate character of the soil; traces of aqueous action on the bed-rock, all lead to the conclusion that these mines occupy the bed of some ancient river, whose level line has been by some terrible convulsion, not raised up, but filled in. Why not raised? may be asked by some. Simply from the fact that if the bed had been raised, the gold-bearing dirt would be as much on the surface as in any other point, which is not the case. The pay dirt is not discovered until the depth of some hundred feet has been reached. Lying along this ancient bed are the following claims: Creary's, Blue Gravel, Pittsburgh, and Yuba River Company, Shamrock and Taylor's claim, in the vicinity of Smartsville, while the same indications are continued through the various claims near Timbuctoo, which were in earlier days so famed and rich." Most of the companies here named have "gone to work in earnest." The last run for the Blue Gravel, $50,000 for thirty-five days. The writer witnessed a mammoth blast, in which three hundred kegs of powder were used.

THE ÆTNA IRON WORKS is the name of the new foundry and machine shop just established at the southeast corner of Fremont and Tehama streets, by Messrs. John Hunscom, Henry S. Smith, Wallace W. Hanscom, and Thomas Pendergast.

To bring up a child in the way he should go—travel that way yourself.

"Grinding Effects of Differently Formed Plates."

REPLY TO W. A. GOODYEAR, CIV. AND MIN. ENG.

BY P. M. RANDALL.

Messrs. Editors of the Mining and Scientific Press:—I have read in your very valuable paper, Volume XII, pages ninety-eight to two hundred and ten, inclusive, with no little interest, Mr. W. A. Goodyear's elaborate discussion of the "*Tractory Curve and the Properties of Grinding Plates.*"

That motives no less pure than the exposing of "*fallacies*" and the enlightening and elevating of the public mind have actuated the author, I shall not at present call in question. Nor shall I doubt his self-imposed avowal that he has "never *seen* a discussion of this curve, other than that contained in the book referred to"—the Quartz Operator's Hand Book. Much less should I question any statement of his to the effect that he had "*never seen a discussion*" of the properties of "Grinding Plates." For the mathematical learning displayed in his discussion of the curve, would seem almost to preclude the possibility of the commission of errors so palpable and radical as abound in his discussion relating to grinding plates of different forms, had he hitherto given any study to the subject.

That the Hand Book is not entirely perfect, I am frank to admit; but if the few errors therein committed be likened to mole-hills, my critic's errors assume the proportions of "Ossa piled on Pelion." There is a saying that "critics, like flies, pass over one's good parts and light upon his sores." Not so in this case. Mr. Goodyear is far more considerate, perhaps deeming it cruel to sting an author in a sore place. So he nobly passes over, for the most part, the little imperfections of the Hand Book, and, like Don Quixote in his famous encounter with the windmill, valiantly attacks those mightier "giants," stubborn facts, rails at them, and terms them *fallacies*—"Only this, and nothing more."

His observation that "the analytical discussion which it (Hand Book) contains of the tractory curve alone, is correct as far as it goes," has reference, I suppose, to the relation of the coördinates of the curve to each other, the rectification of the curve, quadrature of its meridian plane, its surface of revolution and volume of the conoid therein determined, since, by comparison, I find in his discussion, for these properties, the same results. His going farther and determining the cusp points, the convexity on concavity of the curve toward the axes, that the directrix is an asymtote to the curve, and that the curve has four similar and equal branches, will, it is hoped, be found as highly useful and interesting to the general reader, as appropriate for the pages of an elementary treatise on the calculus. The facility with which Mr. Goodyear demonstrates that the evolute of the tractory is the common catenary, is highly creditable to his talents and acquirements. His vindication of D' Alembert and criticism of the Hand Book on this point, are entirely just as well as delicately expressed. But since he informs us that "the tractory curve itself is not a peculiarly difficult one to treat," *modestiæ gratia*, may I not add that I had the pleasure of discovering my error and of demonstrating the truth of D' Alembert's assertion, shortly after the publication of the Hand Book. In the "Differential Calculus, by James Haddon," pages 142 and 143, will also be found a very fine solution of the same proposition; but perhaps less elegant than that of Mr. Goodycar. His conjecture, arising probably from intuitive genius, is also quite correct that "It is not likely that either it (the tractory curve), or the properties of grinding plates, have remained until this late day undiscussed by able mathematicians, other than D'Alembert." That is—*correct*, providing D' Alembert has demonstrated the properties of grinding plates; on which subject the Hand Book is silent and I am uninformed.

His discussion of a certain curve, secondary to the tractory, is not without interest, and the curve itself unquestionably, for some purposes, might prove of no little value. At least, as Mrs. Toodles thought of Thompson's door-plate, under certain conditions "it would be a good thing to have in the house." But should the inventor construct a grinder to work on the principle of this curve, he would find ere long the muller running on the outside of his pan, if not altogether outside of his quartz mill. In passing from the primary to the secondary curve, Mr. Goodyear errs in premising that the wear to the plates takes place in the direction of the normal, reckoned from the point of tangency—this is impossible. No wear can take place in the plates farther from the center or axis than the point producing it. The direction of wear for any point taken in the revolving plate, is parallel with the axis of revolution. The relative position of any point taken in the plate cannot be changed without contracting, enlarging, or breaking the plate; and for that point we have the same ordinate or radius in the secondary curve as in the primary. The above being true, Mr. Goodyear has not come within beat of drum of the demonstration on page 103 of the Hand Book; but on the contrary, has simply conjured up a monstrous fallacy, and then cried out against the creature of his own distorted imagination.

But before going farther, let us distinctly state the main questions now at issue. It is proposed in the "Quartz Operator's Hand Book," to demonstrate that there is a difference in the grinding effects of differently formed grinding plates, all of uniform and same hardness, same diameter, same weight, and running at the same velocity; and that this difference in the grinding effects is due to the several forms of the plates themselves. The forms first discussed and compared, being the Plane, Conical and Tractory Conoidal. The forms next discussed and compared, being the Plane, Conical and Tractory Conoidal Rings, respectively the same as to their exterior and inner radii, weight, hardness and motion. Now, on the other hand, Mr. Goodyear says that there is no difference, and claims to have demonstrated the same. And it is utterly astonishing, that a person of such preëminent abilities, and so profoundly learned in mathematical and mechanical lore as Mr. Goodyear, should have found, neither in his deep investigations nor his extensive researches, a complete refutation of the deductions to which he has come. For, indeed, on this subject he does hut put his pen to the paper, and the sheet is sullied with a blunder. In proof of this, let us turn to a few of the standard authors.

In "Weishach's Mechanics," edited by Walter R. Johnson, page 165, on the subject of Pivot Friction, we find: "If the axle has conical ends, the friction comes out greater than if it has plane ends, because the pressure of the axle R is resolved into the normal forces N, N_1 which produce the friction, and which together are greater than R alone." In the original work of Weisbach, page 317, it is also shown that the moment of friction for tractory-formed pivots is greater than that of those having plane ends.

Professor Rankine, in his work on "The Steam Engive and other Prime Movers," page 17, says: "For Schieli's anti-friction pivot, whose longitudinal section is the curve called the tractrix, the moment of friction is $f \times$ the load, $\times$ the external radius. This is greater than the moment for an equally smooth flat pivot of the same radius; but the anti-friction pivot has the advantage, inasmuch as the wear of the surfaces is uniform at every point, so that they always fit each other accurately, and the pressure is always uniformly distributed and never becomes, as is the case in other pivots, so intense at certain points as to force out the unguent and grind the surfaces."

In "MM. Armengaud, Sen., Armengaud, Jun., and Amouroux's Practical Draughtsman's Book of Industrial Design," pages 181 and 182, we find as follows: "The ingenious and important contrivance of the 'anti-friction curve,' by Mr. Schiele, has found an important application in the grinding surfaces of millstones, in which it has introduced a striking departure from old estahlished principles. The inventor was led to the consideration of this system of working surfaces by the irregularities of wear in the common conical plugged stop-cock. Considering the truncated cone of the stop cock plug to he divided into a series of infinitely short lengths, he proposed to take a more obstuse cone for each larger portion, and in such progression that it would require equal pressure for every portion of the surface to cause a uniform sinking of the plug in the course of wear." (The manner of constructing the curve tractory and a description of his mill here follow.)

The authors then say: "No fixtures are required, as the weight of the parts insures steadiness in working. Perfect uniformity of wear in the grinding surfaces is attained hy the use of the curved face. * * And the inventor states that his experimental results go to show that a two feet runner produces as much flour as a four feet flat millstone, the power required being a minimum."

In the same work will be found a description of the "Ring Millstone," in which the inner radius is about one-half that of the external. And in summing up its advantages over the common millstone, the writers say: "Finally, by getting rid of the great area of *superabundant* stone at the center, the operation of dressing is obviously simplified very considerably."

It is evident from the above quotations, that the authors are clearly of the opinion that there is a difference in the amount of friction generated by differently formed pivots. Also as to the amount of grinding effect of differently formed plates, some of the authors are equally clear. In fact, grinding plates or mullers are hut large pivots. our calculations respecting both are based upon the same laws, except that authors have made no allowance for wear in case of pivots. Let us now determine the measure of this difference as shown by some of our ablest writers on applied mechanics. Turning to "Des Ingenieurs Taschenhuch," pages 143 and 144, and to "Weishach's Mechanics," pages 313 to 318, inclusive, we find the subject fully discussed. We find for the plane or flat pivots,

$$(1) \qquad M = \frac{2}{3} f R r$$

For the conical or pointed pivot,

$$(2) \qquad M = \frac{2}{3 \sin a} f R r$$

For the tractory conoidal pivot,

$$(3) \qquad M = f R r$$

In these formulas M denotes the moment or amount of friction, f the coëfficient of friction, R the pressure, r the radius of the pivot, and a the angle included between the axis and side of the cone. Professor Rankine, in his "Manual of the Steam Engine and other Prime Movers," page 17, expresses in substance the same as above, for flat and tractory formed pivots, hut is silent as to conical.

Taking in the above formulas the moment of friction $f R r$ as the unit, $r = 1$; and in formula (2) r = the hight of the cone, as in the Hand Book, and the relative moments of friction, expressed decimally, will stand for the

(1) Flat pivot ..... ,6667
(2) Conical pivot ..... ,7453
(3) Tractory conoidal pivot 1,0000

Now Mr. Goodyear tells us that there is no difference in the grinding effects of differently formed plates. He would have us helieve, both as expressed hy word and formula, that the relative grinding effects or moment of friction, would stand for

(1) Flat plates or pivots 1,0000
(2) Conical plates or pivots 1,0000
(3) Tractory conoidal plates or pivots. 1,0000

See his formulas (64), (72), and (76).

It is thus apparent, according to the authorities cited, that the moment of friction of flat pivots or plates is hut two-thirds as much as Mr. Goodyear makes it; and that of conical pivots or plates of the given proportion, a trifle less than three-fourths as much; nnd that in the former case this friction or effect is but two-thirds that of tractory-formed plates or pivots, and in the latter a trifle less than three-fourths as much. What of "*fallacies?*"

Mr. Goodyear says in his preface, in referring to the "Quartz Operator's Hand Book," "I am sorry to appear in public to depreciate the work of any man; hut when, in a case like this, fallacies are presented as mathematical demonstrations, it is hut just to the public, who are interested, that they should be informed of the fact."

Now, if he has accomplished what he there proposed, it seems to me, and I think it does to the reader, that he

has given Professor Rankine, Weisbach, Johnson, Schiele, the authors of "Des Ingenieur's Taschenbuch," and MM. Armengaud and Amouroux what the "Robber Kitten" in the *dreary wood* gave the cock, "an awful shock! shock, shock, shock!" But if he has not accomplished what he proposed, he will at least have the consolation left to him in knowing that "it is not the first time in the history of human affairs that the vigor and success of the war have not quite come up to the lofty and sounding phrase of the manifesto."

By applying the same scale as adopted above, in reference to the relative grinding effects of differently formed plates to the formulas obtained on pages 107, 108 and 109 of the "Quartz Operator's Hand Book," and we shall have for the grinding effect of

Flat plates or pivots	,5000
Conical plates or pivots	,5590
Tractory conoidal plates or pivots	1,0000

These results differ from those obtained by the authors cited. The reason of this difference is, that the authors in determining the moment of friction for differently formed pivots, have not taken into account the wear to the pivot itself. That is, they have presumed friction to take place without wear to the pivots, depending upon unguents to prevent the pivot and step coming in contact. Professor Rankine on the subject of unguents, says: "Three results in the preceding table, Nos. 16, 17 and 18, have reference to smooth, firm surfaces of any kind, greased or lubricated to such an extent that the friction depends chiefly on the continual supply of unguent, and not sensibly on the nature of the solid surfaces; and this ought almost always to be the case in machinery." See also quotation hereinbefore given from the same author on the subject of "Scheile's anti-friction curve."

If the pivot and step come in contact so as to grind, I conceive but two cases as to flat and conical pivots, compared to tractory-formed in which the authors cited are strictly correct; one in which all the surfaces are infinitely hard, and the other in which the hardness of all at the circumference is the same, and decreases in the flat and conical pivots toward the center in the ratio of the decrease of their radii. See Hand Book page 107. But if they do not come in contact, being as they should prevented by proper unguent, then for most practical purposes the authors cited are correct.

Comparing results it will be found that the authorities cited, and the Hand Book agree as to the ratio of the moments of friction or grinding effects between the flat and conical pivots or plates, thus,

,5000 : ,5590 : : ,6667 : ,7453

But Mr. Goodyear finds no such ratio. He tells us with the utmost assurance that the grinding effect of plane plates is *one*, that of conical, *one*, that of tractory conoidal, *one*; that it is *one, one, one,* "all the way down," like the rocks on which other distinguished philosophers averred the earth to stand.

Again, to prove the truthfulness of the deductions in the "Quartz Operators Hand Book," relative to the grinding effects of plane and tractory conoidal plates. Conceive a plate having a plane grinding surface, to be made up of an indefinite number of independent concentric rings, all of the same weight and thickness, and let their grinding effects be measured in the plate on which they revolve. It is now evident, if each ring be revolved independent of the others once about its axis or center, that all will wear into the stationary plate at right angles to its face, to the same depth; and hence the secondary surface to which they shall have arrived, will also be a plane.

But if there is no tendency of the rings to pass each other up or down, in other words, in a direction parallel with the axis of revolution, then a solid of the same dimensions and weight, would give the same result. Let us next determine the form and contents of this solid. It is evident that a ring of half the radius of another must be of twice the hight, in order to weigh as much. So a ring of one-third, one-fourth, one-tenth, one-hundredth, or one-thousandth, etc., of the radius of another, must be three, four, ten, one hundred, or one thousand, etc., times the hight in order to weigh as much. The hight of these rings may be determined relatively by dividing the constant radius by the radius of the ring whose hight is sought. The thickness of each ring is to be supposed infinitely small.

The contents, since the rings are all of the same weight, are readily found by multiplying the product of the greater or constant radius, and its circumference by the hight of the ring (outer). Call this plate (A). Now the contents of a plane plate of uniform thickness, and of the same radius and hight as the outer ring in the solid above, are equal to one-half the product of the radius and circumference multiplied by the hight. Call this plate (B).

We thus perceive that the contents or weight of plate (B) is but half the contents or weight of plate (A). And this plate (B) being rigid, as to its parts, would have but half the grinding effect of plate (A). If the grinding effect of plate (A) be a unit (1,0000), that of (B) will be (,5000).

Now the grinding effect of plate (A) has been shown to be uniform like that of the tractory. That is, no portion of the plate impedes or increases the grinding effect of any other portion of the plate. If equally thin rings of the same radius and hight be taken at the circumference of each plate, and revolved about their respective axes, their grinding effects will be equal. Each will wear into the stationary plate to the same depth. But that the grinding effect of the outer ring, taken in the tractory plate, shall neither be impeded nor increased by the balance of the plate, it follows that the vertical hight at all points of the plate, parallel with the axis, is equal to the hight of the outer ring.

The contents of a plate of this form are the same as the contents of a plane plate of equal radius and hight. See Hand Book, page 105. But the contents of the plane plate have been shown equal to half the contents of plate (A).

The contents of the hollow tractory plate are then equal to half the contents of plate (A). But the grinding effects of the tractory, have been shown equal to the grinding effects of plate (A), that is a unit (1.0000). While the grinding effects of the plane plate of equal radius and weight have been shown equal to one-half of this, to wit, (,5000). This is precisely the same ratio as found in the "Quartz Operator's Hand Book."

As to the assumption in the above discussion, that the grinding effect of any portion of the tractory plate is not impeded nor increased by any other portion of the plate, I do not understand that there is any question. On this point, as already quoted, MM. Aremengaud & Amouroux say: "Considering the truncated cone of the stop-cock plug, to be divided into a series of infinitely short lengths, he (Schielo) proposed to take a more obtuse cone for each larger portion, and in such progression that it would require equal pressure for every portion of the surface to cause a uniform sinking of the plug in the course of wear;" also, "perfect uniformity of wear in the grinding surfaces is attained by the use of the curved face." Professor Rankine says: "The wear of the surfaces is uniform at every point, so that they always fit each other accurately, and the pressure is always uniformly distributed." Weishach, in determining the moment of friction of pivots or "toes" of uniform wear, says: "The moment has to be the same on all parts of the *toe*, if we wish to have equal wear of the *toe* and its journal, consequently the tangent for the whole generating curve of the *toe* has to be the same, *a*" —that is, the curve is the tractory. The demonstrations of the other authors hereinbefore cited, agree perfectly with the preceding quotations. And I am happy for once to find, if I understand Mr. Goodycar correctly, that he assumes the same thing. At least his demonstration is based on it.

But as to his attempted demonstrations of the grinding effects of plane and conical plates, it is quite evident that he was either knowing *too little, or too much.*

On page 178 of the Mining and Scientific Press, he says: "Let, now, the actual pressure per unit of surface at the circumference when the plates are in motion be represented by P; represent also the pressure at any point whose radius is *y*, by P'. Then if *a* denote the radius of the plates, we have

$$(62) \qquad P' = P\frac{a}{y}."$$

On these premises he finds the grinding effect of plane plates to be "$2\pi^2 Pa^3$."

And I will add that the result is correctly deduced from the premises.

Taking Mr. Goodyear's premises, let us see what would be the contents of the plate whose grinding effect would be "$2\pi^2 Pa^3$."

Putting V = the volume or solid contents, and we have $dV = 2\pi Pa\,dy$.

Taking the integral between 0 and *a*, and we have

$$V = 2\pi Pa^3.$$

Now, the solid contents or volume of a plane plate whose radius is *a*, and whose uniform pressure or hight, is represented by P, is

$$V = \pi Pa^2.$$

And this (πPa^2) is the volume or size of the plate which Mr. Goodyear tells the public has for its grinding effect ("$2\pi^2 Pa^3$"), when, in fact, as shown above, it is only half the volume or size of the plate which he has employed in his calculations to obtain that result.

Had he told the whole truth, he would have given the same result as found in the Hand Book, page 108, which, by word and formula and pretended demonstration, he has denounced a "*fallacy.*" It is said that "the art of all arts is to appear artless." Estimating by this standard, the palm must be awarded to Mr. Goodyear for having produced the great masterpiece of art.

The results which he obtains on page 194, Equation 72, set forth to be the grinding effect of conical plates, and the manner of obtaining these results, are open to still severer criticisms. There, after committing an error similar to the one in relation to plane plates, he "with one fell swoop lops off" the conic form and substitutes the plane. Having now attained his plane plates of double the weight proposed to be used at first, he all at once becomes highly consistent, and has them accomplish the same grinding effect as his other plane plates of the same radius and weight. By reference to the Hand Book, page 110, and to the formulas of Weisbach and "Des Ingenieurs Taschenhuch," hereinbefore quoted, it will be found that those authors were less *artful;* that they could not strip the cone of its conic form; nor, by any "*agamento, presto change,*" double its real weight, and still have it retain its weight and accomplish as a cone the same grinding effect as a plane plate of equal size and weight. This will be found no exaggeration by any one who will carefully examine Mr. Goodyear's calculations and deductions relative to the grinding effects of conical plates.

If this be the way in which Mr. Goodyear, as the public's benefactor, shows up the "*fallacies*" of authors, it may well be doubted whether he will challenge very much of the respect of mathematicians, mechanics and miners, saying nothing of the confidence of the public.

Let us now turn our attention to the grinding effects of plane, conical, and tractory conoidal rings, as practically employed in grinders and amalgamators. On this point I am frank to admit that the Hand Book is not entirely correct, and I am happy of the opportunity of making the corrections myself. I can but regard myself saved in this respect, as was Rome at the time when the sentinels had fallen asleep. But before making the corrections, let us compare the results obtained by Mr. Goodyear, to those of the authors hitherto quoted. Mr. Goodyear, in the Mining and Scientific Press, page 210, gives for the grinding effects of rings, whose inner radii are respectively one-third of the outer radii, as follows:

"(78)" Plane rings	"1,778"
"(80)" Conical rings	"1,778"
"(81)" Tractory conoidal	"1,778"

All the same—the "*irrepressible*" *unit ratio* still prevailing. It will be observed that he finds the grinding effect of the ring in each case to be less than that of the entire plate from which it was taken. This is only true in the case of the tractory conoidal plate. The grinding effect of the respective plates entire corresponding to the above numbers, is "(2)," as will be seen by referring to his formulas "(64," "(72)" and "(76)."

Turning to "Weisbach's Mechanics," page 313, and to Professor Rankine's "Applied Mechanics," page 617, and we find the following formula in each for the moment of friction of the flat ring pivot or plate, viz.:

$$(4) \qquad M = \frac{2}{3} f R \left(\frac{r^3 - r'^3}{r^2 - r'^2}\right)$$

In which *M*, *f*, *R* and *r* have the same values as in formulas (1), (2) and (3).

Putting $r = 1$, and $r' = \frac{1}{3}$, and we have

$$M = \frac{78}{108},$$

which, expressed decimally, is ,7222.

This we perceive to be greater than the moment of friction for the whole plate or pivot, which, as shown, is ,6667.

Taking now the formula for the moment of friction of the conical ring pivot, viz.:

$$M = \frac{2}{3 \sin a} f R \left(\frac{r^3 - r'^3}{r^2 - r'^2}\right),$$ and making, as before, the hight of the cone equal to one-half the constant radius, and we have for the moment of friction of the conical ring ,8074.

All agree (including Mr. Goodyear) that the moment of friction of the tractoroidal ring of equal weight and radii to the above is ,8889.

Taking the same unit as adopted by Mr. Goodyear,

and we have for the relative moments of friction of pivots or plates of the ring form as follows, to wit: for

(4) Plane ring.....1,4444
(5) Conical ring.....1,6148
(6) Tractoroidal ring.....1,7778

The above results clearly refute the deductions of Mr. Goodyear, not only in regard to the moments of friction of the rings as compared among themselves, but as compared to the whole plates. But the difference in the grinding effects of plane and conical rings as compared to tractoroidal, is greater than above shown; for by the above formulas, (4) (5) and (6), no *abrasion* of the pivot is supposed to take place, while in grinding plates the amount of effect is measured by the *abrasion*.

Professor Rankine says: "The bearings of axles should be made of materials, which, though hard enough to *resist the rubbing without abrasion*, are not as hard as the axle." The quotations already made in relation to unguents and the "anti-friction pivot," go to the same conclusion. Besides, the demonstrations themselves of the author's unmistakeably show that the *element of abrasion* was not introduced.

I will now offer the following solution of the problem of plane and conical grindiug plates, which, so far as I know, is "*original*." I obtained it sometime past, and am *certain* as to its correctness.

In plate (A),

Let a = the radius of the plate.
y = the radius of a central opening in the plate.
P = the pressure per unit of area or hight of the plate at the circumference.
S = solid contents.
E = the grinding effect by one revolution.
V = the solid contents of a plane plate of equal radius to that of (A) and uniform hight = P.
G = the grinding effect of the plane plate whose volume is V.
π = the ratio of the diameter to the circumference.

Then, $ds = -2\pi P a\, dy$

Taking the integral, observing that

S = 0, when $y = a$ $\quad S = 2\pi P a (a - y)$

$dE = -4\pi^2 P a y\, dy$

Taking the integral, observing that

E = 0 when $y = a$ $\quad E = 2\pi^2 P a (a^2 - y^2)$

$V = \pi P (a^2 - y^2)$

$S : V :: E : G$

Hence, $G = \pi^2 P (a+y)(a^2-y^2)$. (1_1)

Now, it has been shown by Weisbach and "Des Ingenieurs Taschenbuch," that the moment of friction of plane pivots is to the moment of friction of conic as "*sin* α," to 1. But

$$\frac{1}{\sin \alpha} = \sqrt{\left(1 + \frac{h^2}{a^2}\right)};$$

α denoting the angle included between the axis and side of the cone, and h the hight of cone.

If G denote the grinding effect of conical plates, we shall have

$$(2_1) \qquad G_1 = \pi^2 P \sqrt{\left(1 + \frac{h^2}{a^2}\right)} (a+y)(a^2-y^2),$$

Making $a = 1$, and $y = \frac{1}{3}$, and $h = \frac{a}{2}$, and substituting these values in equations (1_1) and (2_1), and we shall have, regarding π^2 P a unit.

$G = 1{,}1852$

and $G_1 = 1{,}3251$.

Thus we find the grinding effects, in fact, of the ring formed plates, as practically applied in grinders and amalgamators, to be as follows: That of

(7) Plane plates.....1,1852
(8) Conical plates.....1,3251
(9) Tractoroidal plates.....1,7778

These results differ from those obtained by the formulas of the authors cited. See (4), (5) and (6), for the moments of friction of pivots of different forms. The reason will more clearly appear from the following: They have taken it for granted that one part of the plate does not impede nor increase the moment of friction of any other portion.

On this hypothesis conceive of the plane plate (C) of the same weight and dimensions as plate (B), to be made up of an indefinite or infinite number of independent rings of equal thickness. Let each ring be revolved independently of the others once about its axis, and its grinding effect measured in the stationary plate. It is now evident that each ring will wear into the stationary plate proportional to its weight, which is also proportional to the radius of the ring revolved. The outer ring will wear into the plate to the same depth, or produce the same grinding effect as the outer ring in plate (A); and as each inner ring will wear into the plate proportional to its radius, a cone will be formed or left in the stationary plate whose radius and hight is equal to the radius and hight of the outer ring. Now, as the contents of a cone are equal to one-third the contents of the circumscribing cylinder, it follows that the two-thirds worn away, or into the stationary plate, express the grinding effect of plate (C). Now, as the grinding effect of plate (A), as also of the tractory plate, is taken as the unit (1,0000), the grinding effect of plate (C) is $\frac{2}{3}$ or (.6667).

The same result as obtained by the authors cited. Adopting the same *unit* as taken in the Hand Book, and also by Mr. Goodyear, and we have the same result as found on page 107 of the Hand Book, to wit: $\frac{4}{3}$, or (1,3333) for the relative grinding effect of plane plates, increasing in hardness from the center to the circumference in the ratio of the increase of the radius. Mr. Goodyear correctly obtains the grinding effect of the ring of this plate, to wit: (1,2839), and I congratulate him on his success in discovering and exposing the school-boy error in the Hand Book. In his grapple with the problem of the grinding effects of "Randall's Patent Grinding Plates," his locks appear to have been shorn. With great dexterity, however, he breaks his hold, and the ease and grace with which he then glides over this heavier and firmer-set problem, recall to mind the classic lines of Pope:

"When Ajax strives some rock's vast weight to throw,
The line, too, labors, and the words move slow;
Not so when swift Camilla scours the plain,
Flies o'er the unbending corn and skims along the main."

But personally I have no reason to complain of his results, for he has given these plates more credit than they deserve, in finding their relative grinding effect to be (1,4444).

Let us take three views of the grinding effects of these plates:

1st. Conceive the relative hardness of the two rings of which they are composed to be such that neither ring will impede nor increase the grinding effect of the other; then the inner radii of the respective rings being $\frac{1}{3}$ and $\frac{2}{3}$ and the outer radii $\frac{2}{3}$ and 1, and we shall have by formula (1_1) (1,2591).

2d. Conceive the relative hardness to be such that the weight of the inner ring rests entirely upon the outer ring, and we shall have by formula (1_1) 1,4815.

3d. Let the hardness (as given in the Hand Book) of the outer ring be three times as great as that of the inner. In this case it will appear by investigation that a portion of the weight of the inner ring rests upon the outer ring. In the analysis of this problem it will be found that the outer ring, independent of the inner, produces $\frac{25}{27}$ of effect; by this additional weight, $\frac{5}{27}$ of effect, and that the inner ring produces $\frac{6}{27}$ of effect, making in all $\frac{36}{27}$ of grinding effect, which expressed decimally, is 1,3333.

Recapitulating, we find the grinding effects of various forms and kind of grinding plates to be, for—

Plane plates entire.....1,0000
Conical plates entire.....1,1180
Tractory plates entire.....2,0000
Plane plates entire increasing in hardness, etc.1,3333
Plane plates, ring form.....1,1852
Conical plates, ring form.....1,3251
Tractory plates, ring form.....1,7778
Plane plates, ring form, increasing in hardness.....1,2839
"Randall's Patent Grinding Plates".....1,3333

Mr. Goodyear finds for—

Plane plates entire.....2,000
Conical plates entire.....2,000
Tractory plates entire.....2,000
Plane plates entire, increasing in hardness..1,333
Plane plates, ring form.....1,778
Conical plates, ring form.....1,778
Tractory plates, ring form.....1,778
Plane plates, ring form, increasing in hardness.....1,284
"Randall's Patent Grinding Plates".....1,444

Here the figures are, for what they are worth.

Mr. Goodyear would show by his, that a plane plate of uniform hardness will grind fifty per cent. more than a plate of the same size and weight and hardness at the circumference, and which decreases in hardness toward the center, in the ratio of the decrease of the radius. This, in effect, is saying that the harder the center the greater will be the grinding effect of the plate. Let him but make the experiment. Let the center of the plate be as hard as diamond, if he will, and let the hardness decrease toward the circumference, where it shall not exceed that of lead. Let him run this upon a similar plate, measure the result and compare it to the figures with which he has heralded himself to the public. Indeed, his figures, as clearly shown, for the most part are wrong—wrong, not as to any slip of the pen, but radically wrong. He cannot give a reason, nor point to a single authority, to support his deductions. The facts, as well as the authorities, are all against him. He tells us that the entire plate of any of the forms considered, will grind more than the corresponding ring-plate of the proportions given, which I have proven by the authorities and demonstration to be a mistatement.

He tells us that the plane plate of uniform hardness will grind more than "Randall's Patent Grinding Plates," which statement is doubly refuted.

He tells us that "tractory conoidal plates possess no advantages over plane circular ones, so far as their grinding effect is concerned." Opposed to which solitary assertion stand Rankine, Weisbach, "Des Ingenieurs Taschenbuch," and proof positive.

He tells us that "*none* of the forms considered possess any advantages above any of the others in their grinding effect." And I choose to believe that he is honest. It is said that Nature distributes her gifts more equally than we are wont to believe. So, perhaps in this case, the great goodness of heart ought to be taken as an apology for the errors of the head. Indeed, there is no attribute of spirit known to mortals more divine than that which would raise the *lowly* and *downcast* up to the hights of the most exalted.

The *poor old flat and conical-bottom pans*, which the world is giving the cold shoulder, find one friend left ready to sacrifice his reputation for their good name—a friend that would take them from their obscurity and elevate them to an equality with the tractory-formed "Excelsior."

Knight never drew sword in a more unequal contest, than has Mr. Goodyear against *stubborn facts*. But, hold! I hope, after all his parade and marshaling of his columns of figures, and hurling, defiantly, "*fallacies*" in my teeth, that I do not discover the *white feather*. No! either go down with sword in hand, or yield bravely.

But what means this? "But," says Mr. Goodyear, "it is important to observe that in order that the plates of uniform hardness should have the same pressure at the circumference as plates whose hardness varies as the radius, it is necessary that in the former case the plates themselves should be heavier than in the latter; since in the first case the pressure *increases* from the circumference toward the center, while in the latter it is constant." Again he says: "With the increased weight of the plates, under these conditions is connected of necessity an increase in the *power* required to drive them at an equal speed." Why, let it be asked, did he not state this premise, before giving the relative grinding effects of differently formed plates, and giving those results as though the plates compared were all of the same weight, each to each? But if these plates, the grinding properties of which he has been seeking, are to be of different weights, why has he not shown what the weights are?

It is no where shown, from first to last, that the plates were to be of different weights. The radius of each in the discussion was taken at a, and pressure or hight at the circumference P, for which in each case, in all his formulas, *unit, one* (1) was substituted. If the plates are to be of different weights, then what has he done, not having given those weights, either absolutely or relatively? His figures, by his own showing, are *meaningless*. He might just as well have taken a handful of any other figures indiscriminately and offered them to the public as the results of his solutions of the problems of grinding plates, or have cut the cards or thrown the dice. This is in keeping, though less scientific, with the mode in which Phœnix determined the "*exact time*" in his famous "military survey and reconnoissance." It is worse than *jargon*—Babel, I had almost said, nonsense in folio hound in opossum. Then, again, why lug in power? *Power* was not the subject of discussion, but effect—the *grinding effect of plates of different forms, but of the same size and weight*. And on this proposition Mr. Goodyear attempted to criticise the Hand Book. No mention in that work is made of *power* in *connection* with *grinding effect*. It requires no demonstration to prove that it takes more *power* to reduce *ten tons* of rock, than it does to reduce *one* to the same degree of fineness, from the same condition at first. Any school-boy can tell us that, saying nothing of practised miners and mechanics. What was claimed, and is claimed, and is true, is that the tractory-formed pan will do very much more work than either the flat or conical pan of the same weight. And, I will now add, do the same amount of work at a less expense of *power*.

Mr. Goodyear could not possibly have misunderstood the proposition, and he cannot now pass the threshold of either door at which he seems to be looking, to-wit: "POWER," and THE DIFFERENCE IN WEIGHT OF THE PLATES. On page 210 of the MINING AND SCIENTIFIC PRESS, he formally announced, "*conclusion*." This, then, was "the be-all and end-all" of his discussion.

In conclusion, I hope the reader will find that I have said nothing herein with any unkind feelings; "nor set down aught in malice." I am conscious of but having done my duty to myself and to my partner, Mr. Zenas Wheeler; to the manufacturers of the tractory-formed pans, Messrs. H. J. Booth & Co., the Golden State Iron Works, Miners' Foundry, San Francisco Foundry, Prescott & Schiedel, Oregon Iron Works, the Ætna Iron Works, and to the public. I have but expressed my honest convictions, deduced by no little labor; and, as the boy remarked when he threw the Bible at his brother's head, "If he cannot stand before the word of truth, let him fall." Personally toward Mr. Goodyear I entertain the kindest of feelings, and the utmost of respect. I have met him, and believe him to be a gentleman and scholar; scholar, especially in abstract mathematics, of no ordinary abilities and acquirements.

SAN FRANCISCO, April 20, 1866.

SALES OF THE WEEK

BY THE S. F. STOCK & EXCHANGE BOARD

Friday, April 20.

AFTERNOON SESSION.

From the Stock Circular of Associated Brokers of the S. F. Stock & Exchange Board.

SAN FRANCISCO, SATURDAY MORNING, April 28, 1866.

No unusual requirement exists for money. The market is easy. Bankers loan to their customers at 1@1¼ ₱ cent. per month, and mortgage loans are negotiated at 1@1¼ ₱ cent., with occasional transactions at lower rates. Short loans on the street are governed by the necessities of the borrower and the character of his collaterals, ranging sometimes as high as 2½ ₱ cent., but not often exceeding 1½@2 ₱ cent. Whatever may be thought of the risk of investments for which such rates are demanded, it is quite certain that the money lender is generally well secured, and seldom loses. The better class of mining shares continues to be accepted by capitalists as the basis of loans, but upon those of less prominence accommodations are obtained with difficulty. The supply of capital is fully equal to the demand, and thus far there are no indications of the stringency sometimes prevalent at this period of the season.

The treasure product of some portions of this State and Nevada is increasing, and the receipts from all sources since the date of our last reference amounted to $1,050,000, making an aggregate of $3,750,000 thus far during the current month.

Bullion is in good supply, and the demand not active. Gold bars have been taken to account by bankers and others this week at 840@850, and silver is ranging at ¾@1 ₱ cent. premium for average grades.

The Mining Share market presents a less cheerful view than at the close of last week, and nearly every stock on the list has been sold at a decline. So far as we can learn, this depression has not been occasioned by any unfavorable developments, but is rather owing to a disposition to realize profits made recently. The advance in most stocks over prices ruling a few months since, even at present prices is so very considerable, that many parties think it will not be difficult to enter the market again as buyers at a more opportune moment.

Crown Point has been inactive and dull, declining from $1,375 to $1,310, at 30 days, rallying to $1,330, seller 30, and then selling at $1,260. Advices continue favorable. During the week ending 20th instant, 725 tons of ore were extracted from the mine. Preparations are being made to sink the south incline from the 3d level. In the north incline little has been done recently, owing to water. The main shaft is now down 390 feet. Receipts of bullion thus far the current month have amounted to some $68,000.

Savage rose from $1,100 to $1,150, buyer 30, and $1,125 cash, then sold at $1,100, and was dealt in yesterday at $1,050@1,040. During the week ending 21st inst., 400 tons of ore were hoisted to the surface, as follows: 24 tons 1st class, 270 tons 2d class, and 106 tons 3d class. A well concentrated body of ore has now been reached in the 6th level. The North Potosi chimney is still yielding considerable ore, and is said to promise well for the future. The sinking of the old or main shaft is progressing, and the timbers have been placed in the Curtis shaft for the 1st station. Contracts have been made to sink the two southern compartments in the latter shaft at $10 per foot, and to sink the former will cost $11 per foot. The company's mill reduced 226 tons of ore last week.

Hale & Norcross is in better favor, advancing from $940 to $975, and closed yesterday at $950. The incline from the 700-feet level is down 65 feet, and the drift east from the 535 feet level is in some 290 feet. From the 700-feet level in stoping up to the 7th floor, the mine is thought to look as well as ever. The company have at present enough money at their credit for the payment of a dividend for the current month, and are hoisting some 50 tons of ore per day, averaging $40 per ton.

Gould & Curry fell to $875, rallied to $890 and $900, buyer 30, and was held at the close at $875. The drift running west from the north branch on the 2d station (below the tunnel) is now in 25 feet in quartz, and its quality seems to be improving, but as yet no ore is found. At the end of the south drift, 2d station, a winze is being raised to connect with the 100 feet level, where it is thought ore will be met with. At this point also there is a large body of quartz. Both of the drifts from the 4th station are in quartz, more or less interspersed, however, with parphyry.

Yellow Jacket rose from 780 to $800, fell to 777½, advanced to $825, declined to $780, and sold yesterday at $785@805. During the week ending April 9th, 978 tons of ore were extracted from the mine, and for the same period the receipts of bullion were $22,286.48. Drifting continues east from the bottom of the central or old shaft at a depth of 520 feet, and it is thought that a body of ore will soon be reached. The south mine is said to look well.

Ophir was dealt in to the extent of 388 feet, advancing from $760 to $800, buyer 30, receding to $720, rallying to $750, then dropping to $705, and closing yesterday at $725@710. The body of ore in the 9th gallery, so far as developed, extends 45 feet to the north, and at one point is 45 feet in hight. A fine show of ore is said to exist in the 6th gallery, a short distance west of the old workings, and about 60 feet south of the Mexican line. The face of the opening on the south side is all in pay ore, interspersed with very rich streaks. This deposit is supposed to be the upward continuation of the body found in the 9th gallery, and is likely to prove a valuable addition to the resources of the mine. From the 1st to the 16th instant, 363 tons of low grade ore were crushed at the Atlas mill, yielding $10,088, and during a like period 418 tons same quality of ore reduced at the Woodworth mill yielded $13,207. The better class of ores, from which this selection was made, have been sent to the Central Mill and the Washoe Reduction Works, for treatment by the Freyberg process. The aggregate receipts of bullion thus far the current month exceed $92,500.

Chollar-Potosi has been more active than for some time past, and some 600 feet were sold, advancing from $315 to $340, declining to $310, rallying to $320, and selling yesterday at $305@310.

In the Bajazette Ground they have broken through into old workings without finding ore, but in lower stope a fair quality of ore is being taken from a seam four feet wide. In the stope over head of incline there is no change of a favorable character. From the Belvidere shaft it is thought that considerable good ore can soon be taken. The drift from the 1st station, new shaft, is in 265 feet, and from the second 15 feet. During the week ending 20th instant, 868 tons of ore were sent to custom mills.

Alpha steadily declined from $415 to $350, and sold yesterday at $335. An assessment of $50 per share ($200 per foot) was levied April 24th. Belchor is also lower, declining from $350 to $320, and then selling at $310@312½.

Empire Mill and Mining company receded from 195 to $180, and closed at $175. The damage to the main shaft of this mine by the late fire has proved much greater than was anticipated. The portion below 1st level (where the fire occurred) having been so much injured by the effects of the water settling the earth around it, breaking in its sides, etc., as to make retimbering for a distance of 200 feet necessary. This work we are informed will be completed by the 1st proximo, when operations in the lower levels will be recommenced and vigorously prosecuted. The ores taken from the upper level have been sufficient to meet all current expenses, and are reported improving in quality.

Imperial is in less favor, receding from $149 to $139, and selling yesterday at $139. The third clean-up this month of the Rock Point mill amounted to $16,367, making the aggregate receipts since the 1st instant $40,634.

Bullion steadily declined from $115 to $75, seller 30, and then sold at $70. Overman has been dealt in within a range of $72½@84, closing at $78. Confidence fell from $35 to $27, and closed at $26 bid.

The total recorded sales of Stocks since Saturday last, inclusive, amounted to $993,522.

Mining Summary.

CALIFORNIA.

NEVADA COUNTY.—The Hartery Company will probably commence crushing rich rock during next week. The new mill is said to work to perfection. This claim is only a short distance from the Alison Ranch.

The Lone Jack Co. are down on the incline 531 feet, and ten feet into the ledge. They are taking out rock that will pay seventy-five dollars per ton.

Several new discoveries have been recently made in the vicinity of these two mines.

Mr. H. Mitchell, of Grass Valley, has paid $11,800 for two shares and three-quarters in the Stockbridge mine.

A party of prospectors, the other day, found a well defined quartz lode, from 12 to 14 feet thick and showing some gold, six miles from Nevada City, and two miles from any previous workings. They were to commence sinking a shaft at once.

A bar of gold, from the Lost Hill claims, weighing 317 ounces, and worth $6,042, is spoken of by the Nevada *Gazette*.

Reports from the Excelsior district sum up as follows: Sdow seven feet deep, rapidly melting. All are making active preparations to commence work at the earliest possible moment. The one hundred and fifty people who wintered at Summit City has now increased to four hundred. The Enterprise mill is now working—they have struck richer ore than ever.

The Nevada *Transcript* of April 20th, says, in regard to the mines at Snow Point, three and a half miles above Moore's Flat:

The Star Company, Junietta and one or two others in that vicinity, are running tunnels and sinking shafts. Some of the rock taken out of these claims, it is believed, will pay $40 or $50 per ton. The Knickerbocker Company, on North San Juan Hill, struck dirt on Monday last which is perfectly yellow with gold. At Buckeye Hill, in the Birchville mining district, three-twentieths of the Evans & Co.'s claims was sold on Monday last by Joseph Grant to Michael Murphy and Denuis Ryan for the sum of $7,000 in gold coin.

PLACER COUNTY.—The Pacific silver ledge, near Ophir, is held at higher prices. Mr. Hathaway refused $6 per foot for his interest the other day. Most of the shareholders, at present, are San Francisco men. They intend to prosecute the work of developing the mine with energy.

The *Stars and Stripes* says:

The Hathaway ledge is situated near the Pacific, and shows every indication of being equal to the latter in value, and that the Gold Blossom is in the same range with the Pacific, Hathaway and Ad Valorem silver ledges, situated near Ophir, and is without a doubt as rich as any of them. A careful assay from this mine returned at the rate of $286 in gold and silver to the ton. The ledge, at the depth of thirty feet, is from two and a half to six feet in width, being widest toward the eastern end.

A number of gold quartz claims in the vicinity of Auburn have been sold to parties in New York city.

Reamer's mill—for cement crushing—on the Big Spring Co.'s ground, between Forest Hill and Todd's Valley, is to be increased in capacity from thirty to sixty stamps.

The Dutch Flat *Enquirer* says, in regard to mines at Gold Run:

Among the most prominent claims we visited, may be enumerated the Cedar, owned by Messrs. Brogan, Johnson and others; Home Ticket, owned by Captain Rathburn and G. L. Slocumb; Perseverance, owned by Messrs. Hunger, Robins and Bartlett, and the Huycks' claims. The Cedar recently cleaned up $600, the result of twenty days' washing, while the others we have mentioned will yield each, on an average, about $100 per day. It is also a well established fact that the celebrated blue cement lead, found in the vicinity of You Bet and Red Dog, passes directly through these claims.

CALAVERAS COUNTY—COPPER.—The "Inimitable Copper Mining Company," whose ground adjoins that of the celebrated Union Company, have sued the latter to recover the value of 150,000 tons of ore estimated at $1,500,000; they having, as they claim, encroached upon their ground.

The shipments of ore from the Union mine, for the six days ending April 19th, amount, in total, to 1,124,070 pounds, equal to 562 tons, 70 pounds.

During the twenty days ending April 20th, the Keystone Company shipped from their mine 245 tons of No. 1 ore, and 30 tons No. 2.

Good shipping ore is now being taken out of the Empire shaft.

The Copperopolis *Courier* says:

Never since the discovery of copper in this district, have our mines looked so promising as at present. The Union and Keystone, which head the list of our valuable claims, are being placed in condition for extensive operations, and will yield immense quantities of ore the coming summer.

GOLD.—The San Andreas *Register* says that Mr. C. Thorn obtained $3 from half a pound of quartz taken from the late discovery near Willow Creek.

McGlynn's quartz mill, near San Andreas, will be completed by the 1st of May.

AMADOR COUNTY.—Another gold bearing ledge has been discovered one mile and a half above the Big Bar Bridge on the Mokelumne river.

The Keystone Mining Company are adding twenty stamps to their battery. The mine is said to be paying well.

An eight stamp mill is to be erected by Gardiner and Flahart on the bank of the creek just below the village of Jackson.

The *Ledger* of April 21st, speaks of having seen $1,082 in gold, which was the result of three days crushing, in a ten stamp mill, of rock from the lead of A. W. Rose, called the "Number One," and located near Sutter Creek.

ALPINE COUNTY.—The Rippon Company, in Silver Mountain district, have struck rock which yields at the rate of $150 per ton. They are drifting on the ledge, which becomes better defined as they penetrate the mountain.

The Monitor *Gazette* of April 21st, says:

The Mountain Company have struck a very large body of water in their tunnel, now in over 750 feet. At the delinquent sale of stock of this company on Thursday, only 72 feet were sold, and it averaged two dollars per share over the assessment.

The Pennsylvania Company have partially cut their ledge in the upper tunnel, and it shows some fine rock containing ruby and antimonial silver.

The Active Company has settled most of its indebtedness, and it is expected will soon resume operations.

The tunnel running in on the ledge of the Mowyer Mining Company is progressing finely, being now in over 40 feet, the vein of ore becoming wider and better looking as depth is attained.

The General Grant Company, in Raymond district, have cut a small spur of fine looking rock.

The *Gazette* has been shown, during the week, two assays which it thus describes:

The first is from Leopold Kuh, Virginia, of a parcel of ore from the American mine, in the upper end of the town, and shows it to contain silver $58.68, gold $4.03, total $62.71 per ton, and a large per centage of copper. The second is from Dr. Waters, of Markleville, from an average sample of an eight feet lode in the Winchester tunnel, and gives a return of silver $9.56, gold $79.37, total, $88.93 per ton.

The Buckeye No. 1, has been leased for six years to a company of New York capitalists, which is expected to expend upon it, within the next eighteen months, at least $100,000.

The Balaclava tunnel is now in ninety feet. They have a solid ledge of fine looking ore of two feet in thickness, and about two feet more of loose quartz, including a gangue next the foot wall.

TUOLUMNE COUNTY.—The stock in the Rattlesnake Quartz Mining Company, incorporated about three months ago, has been nearly all disposed of at six dollars per share. One of Moore's grinders has been purchased. Should its operation prove satisfactory, the company intends to add three more, giving them, with their present ten stamp mill, a capacity of forty stamps. Six hundred tons of custom quartz has already been tendered them for crushing.

A writer in the Tuolumne *Courier* of April 21st, gives the following items:

The boys of the old Perley claim, which is situated at American Camp, eight miles northeast of Columbia, washed up out of the tail end of their ground sluices, last week, one thousand dollars.

The prospecting shaft sunk upon the Chappral Hill Mine is now down to the depth of 135 feet, at which point the ledge is ten feet wide, and the rock looks well, and yields well in the mill. The work is superintended by Mr. Jennegan for C. T. Meader, who is thus thoroughly examining the mine with a view of purchasing. It is on the "mother lead," 2,800 feet from the Rawhide.

The American Camp Fluming Company intend to clean up their flue next week, and I hear they expect "big things." They have been running it steady ever since the rains set in.

At or near Middle Camp, about ten or twelve miles above Columbia, Messrs. John Chapman and Mark Waterhouse have lately struck "forty-nine diggings." In ten days they took out $600.

Two hundred and eighty-nine ounces were shipped to the Bay last week, by the Mount Vernon Company, at Sugar Pine.

The owners of the Moss lead, situated about five or six miles above this place, are getting out some exceedingly rich rock.

MARIPOSA COUNTY.—From the *Press* we glean the following items:

Mexicans over in the vicinity of Jimisal, in that county, last week, found a nugget of gold worth $4,550. It is one of the largest ever found in that county.

Bruce & Washburn cleaned up at their quartz mill, on Buckeye, last week, the result showing that the quartz paid an average of twenty dollars per ton.

Encouraging accounts have been lately received from Hite's Cove. The vein owned by John Hite and Wynants, continues to yield at its usual rate. They have a vein 8½ feet in thickness, and paying regularly from $60 to $80 per ton.

A writer in the Mariposa *Gazette*, speaking of the Willamette copper district, in that county, says that a vein fifteen feet in width was struck on the Brummett lode, at the depth of a few feet.

Haskell, at his works on the Chowchilla, last week, smelted, in twenty hours, 5,122 pounds of copper from the Buchanan claim.

The new furnace, at the smelting works of Henry & Co., at James' Ranch, is in operation. The operator, Desormen, turned out seventy-five pigs of copper from Sunday morning until two o'clock Monday afternoon. The furnace is a complete success, and a number of others will shortly be erected. Suediker, who is working the Green vein, is getting out the finest and richest ore in the district. A furnace will soon be erected on the ground for smelting purposes.

PLUMAS COUNTY.—The Quincy *Union* of April 14th, says:

Wood's claim has been worked for the past three months, paying on an average of $12 per day to the hand. Moulton's claims have been paying $14 per day to the hand, for the past four months. Ripple & Bohemo cleaned up, a short time since, $7,000. They expect to make another run before the winter season closes. They work but four men. Anderson & Co., are making $10 per day to the hand. The company working the "Bourbon" ground are making $8 a day. O'Brien's claim, on Lost Creek, is paying well. Mallady & Feeny, on Sly Creek, are averaging $40 per day. A majority of the miners in this locality are pretty well satisfied, so far as the profits of mining are concerned.

HUMBOLDT COUNTY.—The Humboldt *Times* of April 7th, says that Jennings' Oil Well Company have sunk their well 94 feet, and struck a hard sand rock, which yields an unmistakable show of oil. The well of the Oil Creek Company is down 170 feet, and the prospects are very encouraging. The Fortuna Company have received a large amount of machinery for the prosecution of operations on Bear river.

SIERRA COUNTY.—"A piece of gold containing a little quartz" and weighing over eighteen ounces, was recently taken from some bank diggings near Kanaka creek. The diggings are owned by John Montgomery and brother. The gold is all rough, as if recently released from the quartz ledge situated close by.

The Downieville *Messenger* of April 13th, says: Messrs. Rhodes & Murray last week commenced running a tunnel under Main street, starting in on the vacant lot between McDonald's hotel and the butcher shop.

We learn that the Monitor claim, at Sawpit Flat, is washing big pay dirt, as high as 100 ounces a day having been taken out of the main riffle.

SHASTA COUNTY.—Two men have made $13,000 during the last eight weeks, by pounding quartz in a hand mortar. They have made at the rate of about one pound of gold each daily. Their claim is some two or three miles from town. So says the Shasta *Courier* of April 14th.

TRINITY COUNTY.—The *Journal* of April 21st says that reports from all the mining localities in that region are cheering; and quotes as follows from a letter written by a trader at the Forks of the New River:

"We are beginning to show signs of life again. Thompson & Campbell have completed their ditch, conveying water on the hills below this place, and will commence sluicing in a few days. Wm. Myers & Co. have also completed their ditch, carrying water to the hills below the mouth of Virgin Creek. They have a good prospect ahead. John Keach & Co., on Pony Creek, have been at their old tricks—taking out nuggets. Keach showed me one piece of pure gold worth over $200, taken out of the hill side, one hundred and fifty yards from the creek. Wm. O'Bryan & Co. are doing well.

The miners of Douglas City have just commenced work.

One hundred and twenty ounces of gold dust from the Minersville region were sold the other day at Greenhood's bank.

SISKIYOU COUNTY.—The Yreka *Union* gives an account of a great land slide which occurred recently at Deadwood. The mountain above that place, for a distance of 120 yards in length, and nearly that in breadth, slid into the creek, making a complete dam, and backing up the water to the depth of sixty feet. Some of the claims in that vicinity were entirely covered up.

WASHOE, NEVADA.

Important movements have been made in the Mariposa Mill. The old rotery battery has been superseded by three straight batteries, of four stamps each; the pans have been altered to the Wheeler pattern, and the *Territorial Enterprise* says that now "everything appears to go off like clockwork."

From the *Territorial Enterprise* of April 17th, we clip the following:

We yesterday saw, at the office of Bonynge & Hawxhurst, a block of ore weighing 104 pounds, which is undoubtedly the most valuable single specimen ever taken from the Comstock lead. It is almost a solid mass of silver, with a plentiful sprinkling of spangles of gold, and is worth, according to assay $6 per pound, or $624 per ton.

The Sierra Nevada Company are vigorously driving ahead with the work on their new shaft, the double engine formerly used in the old works being used for hoisting. Their new building is about completed. The new shaft is about three hundred yards east of the first or old one.

The amount of bullion shipped from the Gold Hill Express office, for the month of March last, was $490,123.89. For the quarter ending March 31st, 1866, the shipments reach $1,397,659.70.

DAYTON, NEVADA.

THE HALF-EX MINE.—This mine is situated about eight miles distant, in Indian Springs district, and is owned by the Turner Brothers, of Dayton. With a few interruptions, work has been prosecuted all winter, with the most satisfactory results. A shaft is down eighty-five feet, and a tunnel pierces three hundred and fifty feet. A well defined ledge, five feet in width has been found; samples of the ore, crushed at various times during the winter, have paid from twenty to forty-five dollars per ton.—*Dayton Sentinel.*

REESE RIVER, NEVADA.

The Knickerbocker will commence crushing rock about the 15th of May. The mill is nearly completed; and it is said by the Nye County *News*, to be one of the very best in the State.

The Pioneer, after lying idle for two months is about to start again. Arrangements have been made with their creditors.

A correspondent of the Nye County *News*, gives the following items:

The Mount Vernon Tunnel, located in Mammoth district, commenced only two weeks ago, is now in about one hundred feet.

The Bower's have struck a body of rich ore at the depth of one hundred and twenty feet.

The American Flag is now down ninety feet. The vein is five feet in width.

The Josephine shaft is now ninety feet in depth. The ore in sight is estimated to yield 150 per ton.

The Keystone, Gem, Vigilante, and Cactus, are all yielding ores of high grade.

ESMERALDA.

"The New York and Silver Peak Gold and Silver Mining Company, will commence in a few days to build a new mill of the largest size and of the most substantial character."

Two more districts, the Baldy and the Myers, have been organized twenty-five miles east of Aurora.

COLORADO.

There are 150 quartz mills in Colorado, which cost, in the aggregate, $40,000,000.

Wages at Denver are $5 per day.

Mr. Leonard is about to erect a blast furnace and rolling mills at Golden City for the manufacture of railroad iron.

The Ni-Wot Company's new 50-stamp mill, in Ward district, will start by the first of May.

A Montgomery correspondent of the *Colorado Mining Journal*, says the Spring is fairly opening, the snow disappearing rapidly, and mining commencing. The Pioneer Company had got out ore enough to keep its 30 stamp mill running for two months. Tunnel on the Parsonage lode 100 feet in; one on the Andes, 50 feet.

The *Journal* says that the Monitor Co.'s Mill has just started, running by water, and

crushing surface stuff from a large crevice newly discovered at the mill dam. The mill runs eighteen 600-pound stamps.

The Colorado Smelting Company has been recently organized under the laws of the State of New York, with a capital of two millions of dollars. Mr. Lyon, who has been for some time past experimenting on the working of Colorado ores, is President.

A vein of cannel coal, 3½ feet thick, has been discovered within ten miles of Denver, between the Platte and Cherry Creek. The Denver *News* describes it as having been pronounced by blacksmiths of superior quality.

UTAH.

Mr. James Finnerty is about to erect a smelting furnace at the Rush Valley mines, forty miles west of Salt Lake City. Specimens of the argentiferous galena from these mines are described as rich by the Salt Lake *Vedette* and the Reese River *Reveille*. Mr. Hartnelt, who has been engaged in Mexico smelting such ores, pronounces these as similar in every respect.

An extensive bed of coal has been discovered in the valley near these mines.

ARIZONA.

From the Reese River *Reveille* of March 31st, we learn—

"Letters from La Paz say that immense veins, containing many thousand tons of copper ore, have been opened in the Great Central and Mineral Hill mines at William's Fort, and a strong mining excitement has sprung up."

A letter to the Arizona *Miner*, of date Feb. 15th, 1866, speaks of the opening of a gold ledge one mile from Fort Brian, as follows: "Thus far they have stripped the ledge a distance of about twenty yards, and to the depth of six feet, and incredible as it may seem, have scarcely found a piece of rock that does not exhibit gold to the naked eye, and the most of it bears very strong indications of silver, as often seen by the writer in Nevada. On the surface the ledge has an uniform width of sixteen inches, and at the depth of six feet widens out to twenty-three inches; is well cased in wall rock on either side, standing almost perpendicular. At the eastern end of the ledge they have taken up a fine spring of water, which flows the year round from nine to twenty inches of water. They also have wood in great abundance. So far they have taken out about one ton of rock. They contemplate putting up an arastra at once."

IDAHO.

The *World* of March 24th says that wages are $6 per day at Idaho City; and that laborers will be scarce unless there is a larger immigration this spring than is now anticipated.

The Red Bluff *Independent* of April 18th, gives a letter from Silver City, Owyhee District, dated March 18th, containing interesting statistics in regard to the mills and the yield of the mines in that district. From the recapitulation, it appears that there are ten mills, carrying, in the aggregate, 102 stamps; that in 820 days' running time 10,336 tons of ore have been crushed, yielding about $2,000,000. The average yield has been $142.50 per ton.

The *Owyhee Avalanche* says "the existence of diamonds in the district is now as fully established as that of gold and silver," that "different lapidaries in New York and San Francisco have pronounced them such"—and that "those found by Wilson, were not picked up on the surface, but in a deep prospect hole sunk for gold."

The same paper says that a new ledge has been discovered, called the Dardanelles. It is *forty-three* feet thick. Several assays have been made, which show the average of $150 per ton. It lies at the head of Jacobs' Gulch, about two miles north of west of Silver, and the same distance west of Ruby.

MONTANA.

Reports at Helena from Walla-Walla to March 19th, gave the depth of snow on the Bitter Root range at 7 to 10 feet. Mining in the vicinity of Helena will commence about the first of April. (?)

There is a great excitement in regard to the Elk Creek country, Deer Lodge County, 100 miles west from Helena. The creek is reported to be fourteen miles long, and rich the whole distance. The Helena *Radvator* says there are not less than three thousand people there, and that "the roads are lined with the in-going multitude." "Quite a city has already sprung into existence."

The Montana *Post* has this item:

Flint Creek.—The stampede to the big diggings struck at Flint Creek is very large, and the idea is that a very large and rich placer is discovered.

The Indian Creek diggings, thirty-five miles from Helena, are another point of attraction; a Mr. Taylor exhibited a purse of gold of his own digging there—and said he had obtained as high as $1.25 to the pan of dirt.

An active rivalry exists between Fort Benton and the mouth of the Mussel Shell river as a steamboat landing—and the future entrepot for goods up the Missouri.

City College Laboratories,

Southeast Cor. Stockton and Geary sts.

Practical and Analytical Chemistry and Metallurgy.

THOMAS PRICE,

Professor of Chemistry,

(Formerly of the Normal College, Swansea.)

WILL GIVE PRACTICAL INSTRUCTIONS IN QUALITative and Quantitative Analysis and Assaying. The course qualifies students for the application of Chemistry to METALLURGY, MANUFACTURING ARTS, and MINING PURPOSES.

PHARMACEUTICAL and TECHNICAL CHEMISTRY, such as is required by Medical and Pharmaceutical Students, will be taught to such students as may require it.

Course of General Chemistry.

Evening Lectures will be delivered every Tuesday, at half past seven o'clock, P. M., in the Philosophical Hall of the College, without extra charge to the students in the Institution.

On and after the 15th of February, the Laboratories will be open every day, except Sundays, from 8 A. M. to 5 P. M. For further particulars, address

REV. P. V. VEEDER,
Principal of the City College.
6v12tf Or at 406 California Street.

SANTA CLARA COLLEGE, S. J.,

SANTA CLARA, CAL.

Conducted by the Fathers of the Society of Jesus.

The FIFTEENTH ANNUAL SESSION of this College will commence on

Monday, August 28th, 1865.

TERMS—Tuition in the Classical and Scientific Department; Boarding and Lodging; Washing and Mending of articles washed; School Stationery; Medical Attendance and Medicine; fuel, light, baths, etc., per session of ten months..... $350

For further information and catalogues, apply to the President of the College, or to Rev. A. Maraschi, St. Ignatius College, Market street, San Francisco.
3v11 REV. A. MASNATA, S. J., President.

SACRAMENTO SEMINARY.

BOARDING SCHOOL

FOR YOUNG LADIES,

Tenth Street, between F and G.

Session commenced January 8, 1866.

MR. AND MRS. HERMON PERRY,
7v12tf Principals.

A Good Financial Weekly.

The Stockholder:

MONITOR OF FINANCE AND INDUSTRY,

Is published every Tuesday Morning,

At 72 William street, New York,

—GIVING—

Quotations of all Important Bonds and Stock Securities in the United States; GOVERNMENT, STATE, CITY, BANK, INSURANCE, PETROLEUM, MINING, and other miscellaneous Joint-Stock Organizations, with the Financial Statements of the same; Notices of Payment of Interest and Dividends—

fact, all matters that can be of interest to Security-holders.

Its columns will be found replete with important and useful financial information.

The Quotations given are correct, and may be relied upon either for the purchase or sale of Bonds or Stocks.

THE STOCKHOLDER is the *only strictly financial paper published in the United States.*

TERMS, FIVE DOLLARS PER YEAR.

All letters should be addressed,

GEO. M. NEWTON, Publisher,

WM. H. KEITH & CO.,

Chemists and Apothecaries,

PROPRIETORS AND MANUFACTURERS OF

WM. H. KEITH & CO'S WINE OF PEPSINE, OR RENNET WINE, a new and efficacious remedy for Dyspepsia, Gastralgia, etc. WM. H. KEITH & CO'S GLUCOLEIN, a new and valuable compound of Cod Liver Oil, put up in glass jars. WM. H KEITH & CO'S LEMON APERIENT, or Purgative Lemonade, an agreeable, cooling and active purgative, or mild laxative, as required. WM. H. KEITH & CO'S SAPONACEOUS TOOTH POWDER. DEVINE'S PITCH LOZENGES, for the cure of coughs and colds. Wm. H. Keith & Co's Florentine Tooth Wash. Wm. H. Keith & Co's Granula. Effervescent Citrate of Magnesia. Wm. H. Keith & Co's Rosemary and Castor Oil Hair Invigorator.

WM. H. KEITH & Co. being in frequent communication with Eastern and European markets, are continually renewing their stock of Pure Drugs, Rare Chemicals, Fancy Goods, and Toilet Articles. Pure Oils, etc. They also give special attention to replenishing ship medicine chests.

Also, just received, a large and well-selected invoice of HERNSTEIN'S CELEBRATED INSTRUMENTS, consisting in part of Amputating and Obstetric sets, Pocket Cases, etc.

Physicians and others at a distance ordering goods from us, can depend upon having their orders filled with the same regard to QUALITY and PRICE, as though obtained in person, and we give particular attention to packing and forwarding the same.

San Francisco:
Saturday Morning, April 28, 1866.

To Coarespondents.—"L. H. P." writes from Wickenberg, A. T., as follows:

Much of the gold taken out of the Vulture lode contains a large proportion of both zinc and antimony, in a metallic state, which renders it unfit for the market without refining. I wish to get a book on metallurgy, if I can, which treats particularly of the melting and refining purposes. If you would send a book of this kind, I should esteem it a great favor.

The fourth volume of Bruno Kerl's *Huttenkunde* treats very fully of the various processes of refining gold and silver. It is published in German, has never been translated into English, and probably cannot be obtained here. B. Weterman & Co., of New York, have it. No work in English is known to us that is full upon this point.

If antimony is present in large quantity, the greater part of it might be removed by exposing the alloy to a blast of air, at a high temperature. Antimony and zinc can both be removed and the gold refined by fusing it, under proper conditions, with carbonate and nitrate of potash and borax. Circumstances alone can determine whether this method would be cheaper than refining by cupellation.

"Miner," from the Colusa oil regions next week. Further letters from our regular and special correspondents in our next. We have received an interesting lot of specimens from M. A. W., of Georgetown, which will be more fully acknowledged and described in our next issue. If the samples of ore spoken of by our correspondent W. S. G., of Colusa, are sent to this office, free of expense, we will comply with his request.

Gas Fitting, Etc.—We would call the attention of our readers to the card of Messrs. McNally & Hewkine, gas fitters and plumbers, who have recently removed their place of business from their old stand on Montgomery street, to the large new building on Market street, adjoining the Roman Catholic Orphan Asylum. These gentlemen have had over seven years experience in their business in this city, and their work fully attests their skill. Among the buildings recently fitted up by them in this line, are the Occidental Hotel, Donahue & Kelly's Bank, the Catholic College on Market street, the California Savings and Loan Bank, etc., as well as numerous buildings in Santa Clara, San Mateo, Benicia, etc.

Excitement at Salt Lake.—From the tone of the papers at Salt Lake, as well as from private letters received here from that city, it is evident that there is great danger of an outbreak between the two opposing classes. All business relations are very much disturbed, and all classes are affected with great excitement. It is certainly the duty of the Government at once to send a military force there, and put in complete subjection an element which threatens to oppress most seriously all who come in contact with it in Utah. Our people have rights in that Territory equally with the serfs imported from Europe by "the Church," and these rights can never be exercised so long as the tyranny of a priesthood governs, to the exclusion of all other law.

The Vancouver *Register* of March 31st speaks cautiously of a new quartz mining excitement. The locality is 16 miles N. E. of Vancouver. Thus far three or four ledges have been discovered. One, which has been named "Columbia Ledge," is, at a point where it crosses a ravine, fifty feet in width, and can be traced in a westerly direction for half a mile. By assay the rock showed $32 per ton. There is a report of the discovery of rich quartz within ten miles of the Dalles. By some it is considered a hoax.

NITRO-GLYCERINE.

This compound, whose explosive power has recently been so terribly demoastrated both in this city and at Aspinwall, was discovered in 1847 by M. Sobrero, a European chemist, and was first brought into practical use for blasting by Mr. Nobel, a Swedish engineer, in 1864. It is now known under the various names of "nitro-glycerine," "pyro-glycerine," "glonoine" and "blasting oil."

Since its first introduction in 1864, its extraordinary explosive energy, and the consequent promise which it gave of great utility and economy in blasting, have caused it to be rapidly and widely spread. Experiments have been made with it upon an extensive scale in many parts of continental Europe, in England, and recently in this country, all of which, together with the fearful accidents recently caused by it, combine to prove its wonderful and terrible explosive power. But while hastening to derive the benefits expected from so powerful an agent, the process of whose manufacture is simple and cheap, the fact seems to have been either forgotten or disregarded, that the *danger* in handling an explosive compound is directly proportional to its explosive energy, and to our ignorance of the precise conditions under which it will or will not explode.

Nitro-glycerine is practically a *new thing* as yet in the laboratory, as well as in the arts, and few professional chemists, even, know enough of its properties to enable them to handle it always with safety. The reason of this is two-fold. First, although its existence, and the fact of its being explosive, have been known to chemists now for nearly twenty years, it has never until recently assumed an importance sufficient to demand the careful and thorough investigation that such a substance should always receive before being made an article of commerce, and, second, it is an organic compound, and belongs therefore to a department of chemistry in which accurate investigation is often beset with peculiar difficulties, and in which many substances are liable to *spontaneous* changes in their composition from causes that no one thoroughly understands. It is said that nitro-glycerine itself is subject to spontaneous decomposition, and if this is the case, its properties must be liable to change with time, and it may well be possible that a degree of change which is not sufficient to destroy or sensibly diminish its *explosive power*, may yet materially affect the conditions under which explosion takes place. It should be noted that the term spontaneous *decomposition*, even when applied to a substance so highly explosive as nitro-glycerine, by no means *implies* spontaneous *explosion*. The decomposition may be gradual and without noise or violence, and in the case of nitro-glycerine, though there is good authority for the assertion that it is, sometimes at least, subject to this gradual decomposition, there is no proof yet that it ever *spontaneously explodes* at ordinary temperatures.

In no direction is our knowledge of this substance complete. Authorities even differ as to its ultimate chemical composition. Watts' Chemical Dictionary states its formula to be $C^3 H^5 N^3 O^9$, while Nobel's pamphlet and Dr. Price, of this city, give formulæ which are equivalent to $C^6 H^5 N^3 O^{18}$.

These formulæ do not agree with each other. They indicate very different proportions of the constituent elements, and a substance corresponding to one of them would differ materially in explosive power, and probably also in other important properties, from one having the composition indicated by the other.

Again, we have no reliable means but that of careful experiments with proper instruments, to determine the comparative explosive powers of nitro-glycerine and gunpowder, and we know of no such experiments having yet been made with nitro-glycerine. It is stated in Nobel's pamphlet that "nitro-glycerine compared with gunpowder possesses about thirteen times its power when volumes are compared, and eight times its power for equal weight, the specific gravity of gunpowder being taken at 1.0." But the data from which this conclusion is drawn are by no means certain, and it may be far from the truth.

The calculation of the quantity of cold gas generated by the combustion of gunpowder, which in this pamphlet is assumed to be practically 200 volumes, is based upon the assumption that the gases generated are at a temperature of 0° C. or 32° Fah., and a barometic tension of thirty inches. A comparsion is then instituted between gunpowder and nitro-glycerine, and among the *cold* gaseous products of combustion of the latter, are stated to be 554 volumes of steam. There is something apparently obscure about this. It is of course impossible that the 20 per cent. of water theoretically yielded by nitro-glycerine, should exist as steam, and occupy a space of 554 volumes at a temperature of 0° C. and thirty inches barometer. These 554 volumes are in fact a large allowance for the space which this water would occupy as steam at a temperature of 100° C. or 212° Fah. with thirty inches barometic pressure. It is further stated in Nobel's pamphlet that "it is difficult to determine the degree of heat produced by an exploding substance," but that "according to theory, the blasting oil, on account of its complete combustion, ought to develop a more intense heat than gunpowder," etc., and that "it may therefore be pretty safely assumed that the heat developed by the explosion of nitro-glycerine is twice that generated by gunpowder," and upon this assumption is based the conclusion that nitro-glycerine upon explosion yields 10,400 volumes of gas.

Now it is not only difficult, but, in the present state of science, *impossible* to determine with accuracy the degree of heat produced by an exploding substance, and though in the case of nitro-glycerine, this heat is undoubtedly greater than that produced by gunpowder, yet the assumption that it is *twice* as great, is certainly a broad one.

These statements, then, of definite quantitative relations between the powers of nitro-glycerine and those of gunpowder have as yet but very little value, and our actual knowledge upon this point may be summed up in the following words: The explosive energy of nitro-glycerine is much (*how* much, we do not know,) greater than that of gunpowder, and this greater energy is due, 1st to the greater absolute quantity of gas produced, 2d, to the higher degree of heat generated, and 3d, to the greater quickness of combustion, and consequent greater *suddenness* of the shock produced by the exploding gases. The combustion of exploding nitro-glycerine is practically *instantaneous*, which is not the case with gunpowder.

Nitro-glycerine is poisonous both in the liquid form and in that of vapor. A writer in the *Chemical Gazette*, however, says: "The effect of glonoine upon different individuals is exceedingly different and contradictory. Two drops of a diluted solution containing only one drop of nitro-glycerine in ninety-nine of alcohol, produces alarming symptoms of poisoning in one person, while another swallows 200 drops of a similar solution with no other effect than a slightly muddled feeling in the head."

The numerous facts recently published upon this point all agree with the above statement in showing that the toxical effects of nitro-glycerine, even in very minute quantities, are not only unreliable, but dangerous.

The statements as to the volatility of this substance are varied and contradictory: thus, in Nobel's pamphlet it is distinctly asserted that it is a perfectly fixed oil without a trace of evaporation, while the writer in the *Chemical Gazette* above referred to, says: "Pure nitro-glycerine is volatile at ordinary temperatures, a fact which was accidentally discovered by drawing off with a month-pipette some nitro-glycerine which had just been washed with water. Headache and the usual symptoms immediately set in, though not a particle of the liquid touched my mouth or tongue." Facts, however, go to show that if volatile at all, when pure, at ordinary temperatures, it is so only to an almost imperceptible extent, and that under these circumstances therefore little or no danger is to be apprehended from its vapors. It becomes, however, much more volatile when dissolved in either alcohol or other similar volatile solvents, especially when heated, and it is not unlikely that its volatility is increased by moderate heat even when pure, and hence arise some of the dangers attending its manipulation in the laboratory.

But its chief danger, wherever handled in anything but very small quantity, lies of course in its explosive properties. The statements and facts, however, in this connection are not a little perplexing, and utterly fail us if we attempt to deduce from them the precise conditions necessary for its explosion. It is said that *heat* will explode it, and Nobel's pamphlet states that "it can safely bear 212° Fah., but it explodes at about 360," while Watt's Chemical Dictionary says: "At 160° C. (339.2° Fah.) it decomposes with evolution of red vapors, and at a higher temperature, sometimes with sufficient violence to shatter the containing vessel, sometimes takes fire without explosion." Again, in an extract from the *Chemical Gazette* recently read by Dr. Hewston before the coroner's jury, it is said, "an experiment may be made without danger, by placing a small drop on a watch glass and touching it with a red hot wire," and the connection is such as to indicate that the result of this "experiment" is an explosion, while among certain experiments made in Europe last summer were the following:

"*First*—A quantity of nitro-glycerine was poured on a flattened stone; a red-hot iron bar was then made to wear along the surface of the nitro-glycerine without igniting it, and finally *placed into* the blasting oil spread on the stone, which, after being warmed, took partly fire and burned with a flame, but *without* exploding. After removing the iron bar, some undecomposed oil remained on the stone.

"*Second*—A cavity in a stone was filled with nitro-glycerine; a burning wood shaving was introduced, and, on stirring it, the nitro-glycerine burned with a flame, but without exploding. The combustion ceased as soon as the shaving was consumed." Thus, then, although beet will sometimes explode nitro-glycerine, it does not appear that it will always do so, and the circumstances under which heat alone does or does not produce an explosion, do not seem to be well understood.

We know that percussion will explode it, and that is the means for igniting it in its ordinary application for blasting purposes. Nitro-glycerine poured upon an anvil detonates when struck with a hammer, but it is said that the explosion thus produced is merely local, reaching no farther than the surface of the hammer, and that percussion can explode nitro-glycerine in bulk only when it is inclosed in a confined space. But it appears that a tolerably severe concussion will not always explode it even then, for among the European experiments already noticed, is one in which two flasks of tunnel iron (of the same kind as those used by the nitro-glycerine company) filled with nitro-glycerine, were packed into a wooden box, as is customary in forwarding them. After having screwed down the cover, this box was thrown from a hight of nine or ten feet upon the rock below, without any result. Again, if simple percussion or concussion will *always* explode this substance even when confined, it is difficult to imagine how, in the recent terrible explosion at Aspinwall, any portion of the nitro-glycerine on board the ill-fated ship could have escaped the tremendous concussion necessarily produced by the first explosion, so that after the burning hulk had been towed out into the stream, a second explosion, more terrible than the first should have occurred. Yet, such is stated to have been the fact.

It is easy to understand, in the case of the late deplorable accident in this city, how, in opening with iron tools a leaking box of nitro-glycerine, a blow of the hammer upon a chisel might have produced a local detonation either in the saturated wood of the box itself, or upon the surface of the can within (which was doubtless covered with the leaking oil), and how such a local detonation, if occurring upon the exterior surface of the can, might have been capable of reacting upon its thin side with

sufficient percussion force to explode the mass within. This *may* have been the case; but whether it was actually so or not, and whether this constitutes the real explanation of the catastrophe, can never be certainly known.

The explosion of nitro-glycerine in bulk by percussion seems to depend upon the *sudden compression* or hydrostatic pressure, produced throughout the liquid mass by a blow struck upon it when in a confined space. The chemical action which causes the explosion would seem then to commence simultaneously at all points of the mass, and to be generated at each particular point by the compression there felt, so that instead of burning gradually, the whole mass bursts into gas simultaneously, and with the quickness of the lightning. This is very different from the *modus operandi* of the burning of gunpowder, the ignition of which, as is well known, is a gradual process, beginning at the particular point where heat is first applied, and spreading from thence gradually, though quickly, through the mass, each grain of the powder being first ignited by the heat generated by the previous combustion of other grains.

It is stated that nitro-glycerine freezes at a comparatively high temperature (42° Fr.), and that the frozen oil explodes by percussion as well as the liquid—an unfortunate workman in Europe having been instantly killed and blown high into the air, while attempting to break a small lump with a pick.

It will be seen from what precedes, that, in many important respects, the properties of nitro-glycerine are as yet but very imperfectly known even to chemists. Further investigations may succeed in rendering its manufacture and transportation perfectly safe; though if it be subject to spontaneous decomposition or change at ordinary temperatures, this is a very doubtful matter, and it will be apt to always possess something of a treacherous character.

One thing is certain, no compound possessed of such terrible explosive powers as this, and whose properties are so little known, should ever be made an article of general commerce in bulk, or be transported by the ordinary means of conveyance. Whether it be nitro-glycerine today, or any one of the numerous lists of organic and inorganic explosive compounds known to chemistry in the future, if such be made an article of commerce before having been *thoroughly* investigated, or before *the people* as well as the chemist know its properties, and the condition necessary to produce its explosion, disaster *somewhere*, sudden and terrible, will be sure to follow.

The Best in America!

THE

Mining and Scientific Press,

Is the Largest and Best Mining and Mechanical Newspaper Issued in the United States.

DEWEY & CO.,

Patent Agents, Publishers, Book and Job Printers, **505 Clay street,** San Francisco.

THE MINING AND SCIENTIFIC PRESS is published every Saturday. Each issue embraces SIXTEEN PAGES (64 columns), and furnishes more valuable reading matter than any other weekly journal in California.

To the practical mechanic, metallurgist, prospector, millman, mine holder or worker, it is worth many times its subscription price. Its files contain a record of the improvements in mining machinery, the progress and development of the mines, and all new methods and processes for working and saving the precious metal—all progressive information, in fact, transpiring with THE TIMES—which cannot be obtained from books.

The MINING AND SCIENTIFIC PRESS is now in its TWELFTH VOLUME, and enjoys a large circulation. It received the following hearty endorsement of the California Miners' State Convention, held at Sacramento, January 17th, 1866:

RESOLVED, *That we regard a mining paper or journal of great importance to the mining interests of California and recommend the* MINING AND SCIENTIFIC PRESS, *of San Francisco, to the consideration and support of the miners of the Pacific coast.*

Terms of Subscription.—One year, $5; six months, $3—in advance. Send for sample copies. Remittances may be made by mail at our risk, if parties sending will register their letters.

AS AN ADVERTISING MEDIUM throughout the whole Pacific States and Territories, the PRESS is unsurpassed. Rates moderate.

OUR PATENT AGENCY

Is in most successful operation. We have had, proportionally, fewer rejections than any other agents during the past three years. *We can secure letters patent to inventors on the Pacific coast from 60 to 90 days sooner than they can obtained through Eastern agencies.* By ready conference with us, our inventors will avoid all informalities, liabilities of misconceptions, and vexatious and dangerous delays. We have an able and faithful assistant at Washington. We secure patents in all countries where patent laws exist. Our terms are as reasonable as any reliable agency in the United States. ☞ All communications treated with strict confidence. ☜ Circulars sent free.

BOOK AND JOB PRINTING.

Our facilities for doing good, rapid, and cheap printing are not surpassed in San Francisco. We employ none but the best workmen, and use our best efforts to please patrons, and advance their legitimate interests. The FIRST PREMIUMS for Book and Newspaper Printing were awarded to Bowey & Co., by the Mechanics' Institute Industrial Exhibition, San Francisco, and the State Fair, Sacramento, in 1866.

Engraving, Electrotyping, and Stereotyping promptly attended to. Address,

DEWEY & CO.,

April 1st, 1866. San Francisco,

A. T. DEWEY, C. W. M. SMITH, W. B. EWER.

Mining Record

—AND—

INTELLIGENCE OFFICE.

We have established, in connection with this paper, a Mining Record and Scientific Intelligence Department, where persons desirous can obtain information with regard to any particular Mine or Mining District. All information already in our possession will be furnished free of expense, on application at this office.

CONSULTATIONS, ETC.

Being in direct and constant communication with the best and most experienced Metallurgists and Practical Chemists in the country, we are prepared to hold consultations and furnish advice on all matters relating to Metallurgy and the application of Chemistry to the Arts. Manufacturers and others about to enter upon branches of industry comparatively new or but imperfectly understood, will do well to call upon us for advice. When desired they will be put in communication with such persons as will be best able to give them the latest and most reliable information and assistance upon such matters as they desire to be informed upon. No charge will be made by us for any service we may render in such cases. When experiments are required, or valuable information is sought, which must be obtained from EXPERTS, we shall leave them to make their own pecuniary arrangements with parties to whom we may introduce them; it being our aim to merely bring them in contact with reliable men, so that they may thereby avoid the immense pecuniary losses which are so frequently incurred in this country by pretentious charlatans, who manage to ingratiate themselves into the favor of those who are seeking for information upon scientific matters, or intricate and not generally understood branches of business.

Persons about to erect furnaces for Metallurgical or other purposes; and who may themselves not be personally acquainted with the work in contemplation, will find it to their advantage to consult us previous to entering upon any such undertaking.

Questions by mail, accompanied by postage stamps, will receive due attention.

MINING EXAMINATIONS AND REPORTS.

Persons desirous of obtaining full and reliable reports upon Mines or Mining Properties; or Survey and Maps of the same, etc., will do well to make application for such service through the especial agency connected with this office.

ASSAYING AND WORKING TESTS

All orders for assaying will be promptly and faithfully attended to. Working tests will be made when ordered. Ores will not be received unless the express or transportation charges are paid by the sender. In all cases parties can witness the treatment of their ores. Terms moderate. Orders from the mines especially solicited.

☞ All supposed new minerals or organic substances will be reported upon free of expense to such parties as will send the same to this office free of expense of transportation; and when proper and consistent with the wishes of parties interested, notices of the same will be given through the columns of the MINING AND SCIENTIFIC PRESS, and the contributions placed on exhibition in our cabinet.

QUARTZ OPERATOR'S HAND-BOOK

A Book for Every Intelligent Prospector, Shareholder, Miner and Machinist.

ZENAS WHEELER AND P. M. RANDALL,

Authors and Publishers.

BOUND IN CLOTH—144 PAGES, DUODECIMO.

THE QUARTZ OPERATOR'S HAND BOOK is presented to the public as a carefully prepared epitome of all that is valuable for the practical operator in the mine and mill. We have here all the most necessary hints and directions for testing and assaying the ores of the various minerals; an explanation of chemical terms; a brief and intelligible description of the numerous processes for roasting ores, and the extraction of metals from their ores by amalgamation and otherwise.

The work also contains an original and highly interesting discussion of the tractory and differently formed grinding plates, as applied to the reduction of ores—a subject not only of special interest to the scientific reader, but also practically of the highest importance to every quartz miner.

Professor Silliman, of Yale, and Hodgson, of the College of California, having examined this discussion, as submitted to them by its author, Mr. Randall, previous to the compilation of this work, speak of the same as not only mathematically correct, but also as of great practical value. Messrs. W. R. Eckart, Jr., Engineer, (late of U. S. N.,) and W. M. Brisbaw, assayer and superintendent of the S. T. M. Co., to whom the entire work was submitted while passing through the press, speak of the same as one of high practical importance to quartz miners and millmen generally.

No work has been offered to the mining public of California which contains so much valuable information, condensed into so convenient a space as is here presented. In its preparation, much care has been taken to secure brevity, conciseness, and simplicity—in fact to make it a complete and reliable QUARTZ MINER'S HAND BOOK.

The Table of Contents of this book will be found on pa 415 of the MINING AND SCIENTIFIC PRESS of July 1st, 1865.

Sold by booksellers generally. Price by mail, postage paid, $1.25. Address "Wheeler & Randall, at the Mining and Scientific Press Office, San Francisco." 2v11

ANNUAL REPORT

—OF THE—

Pacific Insurance Company.

IN COMPLIANCE WITH THE ACT OF THE LEGISLATURE of the State of California, entitled "An Act concerning Corporations," passed April 22, 1850, the Pacific Insurance Company of San Francisco makes the following Annual Report:

I.—The amount of the Capital Stock of this Company is SEVEN HUNDRED AND FIFTY THOUSAND DOLLARS, and paid in GOLD..... $750,000

II.—The amount of the Assets is ONE MILLION AND FIFTY-ONE THOUSAND, FOUR HUNDRED AND TWENTY DOLLARS AND THIRTY-SEVEN CENTS..$1,051,420.37

III.—The Company has NO DEBTS

IV.—The amount of insurance effected during the year, and which remained in force December 31, 1865:

Fire	$12,973,949
Marine	434,408

This Company commenced underwriting Marine Risks, August 1, 1855:

V.—This Company insures against the following risks, viz.: BUILDINGS, HOUSEHOLD FURNITURE, MERCHANDISE, RENTS, LEASEHOLDS, VESSELS IN PORT AND THEIR CARGOES, and other PERSONAL PROPERTY, AGAINST LOSS OR DAMAGE BY FIRE.

Also, on CARGOES, TREASURE, COMMISSIONS, PROFITS, and WAR RISKS, and ON ALL MARINE AND INLAND NAVIGATION RISKS, TO AND FROM ALL PORTS IN THE WORLD.

VI.—This Company will take on any FIRST-CLASS RISK not to exceed $75,000 (the limit fixed by law), and on all large risks will reinsure to an extent consistent with PRUDENCE in other RESPONSIBLE COMPANIES.

J. HUNT, President.
A. J. RALSTON, Secretary.

TRY IT 50 PER CENT SAVED BY USING

STANDARD SOAP COMPANY'S WASHING POWDER.

THIS POWDER IS SUPERIOR TO ALL OTHER PREparations for washing and cleansing. It is made of pure material, and contains nothing that will injure the finest fabric. Equally as good for using in hard as soft water. One pound will make three gallons of beautiful soft soap. Put up in wrappers of 1-lb each, and in wooden boxes of 10-lbs bulk. Ask your grocer for a package, and test its virtues. Manufactured at **207 Commercial street,** San Francisco. 15v12

Metallurgy.

EUROPEAN METALLURGICAL WORKS,

—AND—

Practical Mining School,

Bryant Street, Between Third and Fourth,

SAN FRANCISCO.

THE Proprietors are at all times prepared to work or test Ores sent to this establishment—either in large or small quantities—by such process as may be found best adapted to their chemical character, after a careful analysis has been made. Test lots of Ore adapted to the smelting process attended to. Sulphuret, pyritous and the (so-called) "refractory ores," are having especial attention paid to their successful treatment. Assaying in the humid and dry way. Also, refining by cupellation, done at moderate rates.

PRACTICAL MINING SCHOOL.

The proprietors—encouraged by numerous applications from gentlemen desirous of pursuing the study of practical metallurgy—have concluded to admit parties on reasonable terms. Having in their Mill all the necessary appliances for crushing, roasting, amalgamating, smelting, refining and assaying, as also a well extended Laboratory for the analysis of Ores and Minerals, a good opportunity is here offered to acquire a sound practical knowledge of the business.

Oakland Water-Cure.

APRIL 1ST, 1864, WE OPENED A HYGIENIC BOARDING House and Ladies' Health Institute in Oakland. The great advantage we have experienced since that time, in the treatment and cure of all those diseases peculiar to females, as well as those common to all, over that of San Francisco, induced us to give up the treatment of gentlemen in the city. We have accordingly removed our entire Bathing, Electro-magnetic, and Gymnastic Apparatus, which we used especially in the treatment of females, to our Health Institute across the Bay, and have found, after a trial of seven months, that gentlemen as well as lady patients recover, at our Fountain Farm Cure, one-third faster than in the city of San Francisco. The climate here is the most even and bracing to be found in the State. The grounds command a view unsurpassed in the world. The Institution is furnished with an abundance of pure, soft water, from numerous springs; and we now offer to Ministers, Teachers, Lawyers, Miners, Merchants, Mechanics, Farmers, and all other worthy persons, who desire to try the advantage of the only *rational* system of medicine, the hospitalities of our Hygienic Home and Cure. Young men who have become debilitated or lost their health by excessive toil, exposure, disease, or basis, contracted through Ignorance of Physical Laws, may with us find more of the encouragements they need, and means that will restore them to health, than elsewhere in California.

We claim for Water-Cure and Hygienic Medication superior advantages over all systems of drug medication in the cure of all disorders, whether acute or chronic; that it is followed by none of those debilitating diseases, such as Piles, Chronic Diarrhœa, Torpid Liver, Constipation, intense Nervousness, Neuralgia, etc., nor those terrible Secondary Diseases, known as Varicose Swelling of the Veins, Necrosis, or Decaying of the Bones, Ulceration of the Limbs, Mercurial Rheumatism, Urethal Strictures, etc., which we well know result from the free use of mercury and other metallic drugs, or even the milder stimulants and vegetable poisons given to overcome acute diseases.

The Oakland Water-Cure and Eye Infirmary is by far the most complete in its facilities for the cure of all diseases commonly treated in all Eastern Water Cures of any like establishment on this coast, and the only one in California conducted according to the Theory and Practice of the New York Hydropathic College. We use all forms of Warm and Cold Wet Sheet Packs, the Electro-Chemical Bath, Steam Baths, Improved Sitz Baths, Douch Baths, a Patent Spray Bath, and Magic Baths. The last named was instituted by Dr. Smith with special reference to the cure of those diseases peculiar to miners, namely: Rheumatism, Inflammatory or Chronic, Stiff Joints, Paralysis, Mercurial, Lead, and Oil Poisonings. It is a sure cure for Ague and Fever. It aids more than any other Bath we have yet used in eradicating all kinds of drugs and infectious poisons, and in the cure of all disorders induced by exposure to dampness and water, foul air, absence of light and electricity, retorting metals, the malaria of rivers and low marshy grounds. Where there was a fair constitution left, even when drugs had been applied for months and years without a cure, we have, in the past seven years, treated successfully the following diseases: Chronic, Inflammatory and Mercurial Rheumatism; Paralysis; Lung, Bronchial and Catarrhal Affections; Diseases of the Heart, Kidneys, Liver; Dyspepsia, Constipation, Erysipelas, Scrofula, Piles, Inflammation of the Bowels, Chronic and Acute Diarrhœa, and all diseases and weaknesses peculiar to male and females. No physician in California is so favorably situated to furnish so many home comforts and hygienic conditions that are indispensable to the speedy recovery of nervous and chronic invalids. We have the only truly delightful boarding place in the State for men, women and children, with plenty of saddle and carriage horses for the use of patients and boarders.

To that class of Diseases and Weaknesses peculiar to females, and the medication that Hydropathic or Hygienic physicians employ in their cure, do we invite the special attention of patients and their friends. The ease and rapidity with which females suffering from general or special debility, recover in the bracing climate of the Bay, under Hygienic Medication, together with the universal success that has attended the treatment of females at Dr. Smith's Institutions, (both in Sacramento and San Francisco) has induced us to make this class of human afflictions a specialty of our Institution. We have treated (mostly in the cure), over 300 females, several of whom had been "bed-ridden" for months and years, and all have been decidedly benefited, and with but few exceptions, returned to their homes in from two to six weeks, so far recovered as no longer to need a physician. We have never yet learned of a single instance of a relapse into their former condition.

There is not one female invalid in twenty that has been suffering from nervous debility or diseases peculiar to her sex, that cannot be permanently cured by spending from four to six weeks at our Cure, and at the mere cost of $100. This statement we make in confidence, from an experience of the last seven years. From the many who have been treated at our Cure, we have yet to learn of a single regret from husband or wife of the time or means they have expended in Hygienic Medication.

NEW YORK, Aug. 1, 1858.

To all whom it may concern:

This certifies, that Dr. Barlow J. Smith is a graduate of the New York Hygieo-Therapeutic College, which College has a regular Charter from the Legislature of the State of New York, and is authorized to grant Diplomas, conferring on its students all and the same privileges and immunities in relation to the practice of the Healing Art, that are conferred by the Diplomas of any Allopathic or other Medical College in the country.

Dr. Smith has also devoted much attention to Phrenology, especially in its connection with Physiology and Pathology, a portion of the time under the instruction of Fowler & Wells, of this city, and has labored successfully as a teacher and lecturer on these subjects.

R. T. TRALL,
Principal New York Hygieo-Therapeutic College.

To all whom it may concern:

I have known Dr. Barlow J. Smith, both in our office as a Student, and a practical Phrenologist in the country, and from what I know of him I can cheerfully recommend him as an honest, faithful delineator of character, and as such can cheerfully recommend him to the public.

For the good of Science.

L. N. FOWLER, 308 Broadway, N. Y.

Dr. Smith spends a part of each day in San Francisco, attending to family practice and to Phrenological and Physiological examinations at his office, Room 13 Armory Hall, up stairs, corner Montgomery and Sacramento streets Office hours from 11 A. M. to 2 P. M. Circulars sent on application. Address,

BARLOW J. SMITH, M. D.,
20v11tf San Francisco, Box 473.

GEORGE E. BROWN,

(Late Assistant Examiner in the U. S. Patent Office,)

HAVING RESIGNED THAT POSITION AFTER A TENure of office of eighteen months, offers his services to

INVENTORS AND THEIR ASSIGNEES,

—AS A—

Patent Solicitor,

He will make Preliminary Examinations in the Patent Office, with a view to ascertain the Patentability of any invention that may be submitted to him for that purpose; will prepare the necessary papers for those who wish to make Applications for

Patents for their Inventions,

—OR FOR—

EXTENSIONS OR REISSUES OF PATENTS

Already granted; will act as an Attorney in presenting Applications at the Patent Office, and in managing them to a final issue; will draw up Assignments; will examine into the condition of Rejected Applications when desired to do so, and undertake the prosecution of such as may be considered patentable, and do whatever else is usually done by Patent Solicitors.

Address, P. O. Box 257, Washington, D.C. 7v12-3m

The Great Pain Annihilator.

DR. E. R. JOHNSON WILL WARRANT TO CURE ALL cases of Asthma, Fever and Ague, Catarrh, Sore Throat, and Womb Diseases. The Doctor's success is miraculous in cases of RHEUMATISM, NEURALGIA, CONSUMPTION, GOUT, PARALYSIS, INFLAMMATION OF THE EYES, and all other diseases that human skill can reach. Rheumatic Pains removed in five minutes. Some of the afflicted that visit him come from one to six hundred miles, and seek and find relief. Persons at a distance can be cured at home by addressing a letter to Dr. Johnson, No. 700 Market Street, San Francisco, stating case, symptoms, length of time the disease has continued, and have medicine promptly forwarded to any part of the country, with full and plain directions. ☞ Consultation by letter or otherwise, FREE. 16v12-1m

[Written for the Mining and Scientific Press.]

From El Dorado County.

BY OUR TRAVELING CORRESPONDENT.

MESSRS. EDITORS:—We parted company, as you may remember, at Lyon's Dale. Setting out from this point for Coloma via Spanish Flat, Kelsey and the Plymouth mill, we must leave it to your own imagination to call up the varied and beautiful scenery everywhere presented to view, from grassy vales fenced in by barrier cliffs, or from lofty peaks of waving pines, or thickly studded evergreen, and hurry you along by a course no less tortuous and rapid than that of the numerous little mountain streams, now crossed and recrossed, as they go dashing, splashing, whirling downward towards the South Fork of the American river.

But leaving landscapes to the painter, and their description to the poet, let us, without further preface or preliminary, proceed at once to a few more facts that may be of more interest to the miner, the political economist or the capitalist. Without attempting to describe in detail all the mineral lodes of this portion of El Dorado, many of which are believed and known to be exceedingly rich, perhaps not inferior in point of permanence and value to those of the counties of Amador and Nevada, we are compelled to make a selection of a few only of those found, as a sample of the many that crop out on almost every hillside and in every ravine, as laid bare by the swollen torrent or ground sluice or hydraulic of the placer miner, and from whose decomposed sulphurets or quartz he has often reaped his richest harvest. Following the meanderings up Irish creek to a point on its right margin, one and a half miles south of the Blue Ledge mill, we find ourselves at

THE MANSFIELD,

A claim but recently located, and owned by Messrs. Frost, Carothers & Co., having a lode from nine to ten feet in width, extending from south to north along the side of one of those mountain ridges which everywhere abound in the vicinity. The quartz is of a bluish cast, containing more or less of the sulphuret so frequently spoken of and peculiar to this district, and lies in two veins near the walls, which are a species of slate, the space between the quartz veins being occupied by a sandstone or metamorphic slate, somewhat similar to that found in the Blue Ledge as formerly described. An incline follows the lode down to the depth of forty feet at the angle of its eastern dip, exposing ore along the different points of its line, containing many small particles of gold, which does not require the practiced eye of an adept to discover.

This lode is well situated for working, being convenient to a 20-stamp mill, where they can have their rock crushed as soon as it is taken from the mine, which will enable the company to prospect their claim to greater depth. They have an abundance of wood for timbering, and water for mills and machinery, and are making preparations to pursue the work of development the coming summer with vigor.

Having lingered but a short time at Spanish Flat, near which there are some promising quartz lodes, we come next in order of our notes to

THE RED HILL CLAIM,

One mile south of this village, belonging to Messrs. Doncaster, Henry & Lackey—the last named gentleman only *lacked* a little of being born *lucky*, not only literally but really, for while I was watching the interesting process of a "clean-up," in miner's parlance, he took out, besides some smaller and more delicate specimens, the largest and most beautiful nugget of quartz gold that I have had the pleasure of seeing since arriving in the country. It was worth $40 to the merchant; to me $100. How or why, it does not matter. It is enough to know that one force or cause often produces a variety of motions, emotions and sometimes commotions. Again to the figures. I have it on most unquestionable authority that over $40,000 have been washed from this hill since work commenced upon it, sometimes as much as $5,000 per week, many nuggets weighing as high as $300 apiece. This, it is true, was in the past; but the mine is not yet exhausted. But while it may be even inexhaustible, it is

now less accessible, requiring more brain, labor, capital and machinery to obtain a given amount of the precious metals in a given time, while the evidences of their durability and richness may be as patent now as ever. The west wall is of slate, the east is thought to be a kind of greenstone. The pay veins lying near the walls are probably 100 feet apart, and widen from six inches on the surface to about two feet at the depth of sixty-five feet, the bottom of the deepest shaft.

The whole expense of sinking, drifting and timbering, a considerable amount of which had been done, has been paid by simply panning out the gold—set free by the decomposition of the quartz, slate and sulphurets, together with some arsenurets of iron. Taking up a piece of this decayed mass from a heap of what seemed to me waste rock, I found, to my great astonishment that it was rich in free gold. The Indians of the neighborhood have been turning this rubbish to good account as the nearest reservoir could testify. Whether the untutored savage had ever looked back into the long ages for the causes of this decomposition, or had ever considered the effect of heat, moisture and oxygen upon the life, death and decomposition of the mineral, he certainly had discovered an important *fact*, and was but a little in the rear of his civilized neighbor, for the most experienced chemist has thus far failed, unless at great cost or but very imperfectly, to transform the living compact salpharet into lifeless, crumbling matter, thus releasing the full amount of its precious contents to the uses of commerce and the wants of man.

THE PACIFIC IRON WORKS,

First & Fremont Sts., between Mission & Howard, San Francisco.

The proprietors of the above Works invite the attention of all parties interested to their greatly improved and unequaled facilities for manufacturing Steam Engines and Boilers, both Marine and Stationary, of any required size and pattern, Quartz Mills, Amalgamating, Pumping and Hoisting Machinery of the most approved construction. Flour, Saw, and Sugar Mills, Water Wheels, &c., &c. Our pattern list is most complete and extensive, embracing the late improvements in all classes of machinery adapted to use on this coast. We would call especial attention to the fact that we have secured the exclusive right of manufacture for the Pacific Coast of the celebrated Greene Engine, conceded to be the most economical and perfect working Engine now in use. We are also exclusive manufacturers of the celebrated

Bryan Battery, Varney's Amalgamators and Separators, Ryerson's Superheated Steam Amalgamators and Rotary Crushers, Stone Breakers, &c. Orders respectfully Solicited.

GODDARD & COMPANY.

REMINGTONS'

ARMY AND NAVY REVOLVER,

THE REMINGTON REVOLVER

Has been approved by the United States Board of Ordnance, and has so satisfactorily met the requirements of the Government, not only in the field, but in the official tests and examinations made by prominent officers of the Ordnance Department, that it stands at once the most popular, serviceable and approved arm of the kind in use. Upwards of 126,000 have been supplied to the Government within the past four years, for the land and naval service, furnishing ample evidence of the estimation in which the arms are held.

Simple and symmetrical in its entire construction, securely strong, of most modern improvement in mechanism and material; its unequaled range and penetration, together with its durability, are points in its favor now well known, and which challenge a comparison with any other pistol of the kind made in this country or in Europe.

The superior strength and capacity of the arm for constant and long use is apparent from the fact that the entire frame is constructed of a single piece of metal, thus preventing the extension of some portions of the frame, from the effect of firing—a serious defect in many pistols—in which the frame is composed of two or more parts.

The frame of the Remington Revolver furnishing a TOP STRAP or support above the cylinder, served to protect the base pin (on which the cylinder revolves) from any undue strain to which it would otherwise be subjected, and which would immediately render the line of fire from the cylinder to the barrel imperfect, thus destroying force and accuracy.

Another advantageous feature of the arm is the means afforded for the instantaneous removal of the cylinder from the frame. This not only facilitates the cleaning of the pistol, but by the quick adjustment of the cylinder, one pistol can be made as effectual as two—and, considering the difference of weight, it is far preferable—by simply possessing a spare cylinder loaded and capped to instantly replace the exhausted one.

The above is a general summary of the points of peculiar merit in the Remington Revolver which a trial of the arm is only needed to attest. For sale at Manufacturers' rates, by

UNION IRON WORKS!

Corner First and Mission streets,

SAN FRANCISCO.

ESTABLISHED IN 1849.

HAVING INCREASED OUR FACILITIES IN EVERY Department, we are now prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps of all kinds, Hoisting Gear, Gas Work, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic, Hay, Rag, Screw and Drop Presses, Coining Machinery, Pile Drivers, Bark and Malt Mills, and all kinds of Castings.

Engines.

Marine Engines, Oscillating and Beam; Stern and Side Wheel Boats, Locomotives, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott and Eckart's Adjustable Cut-off Regulator—best in use; W. R. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pump and Fire Engine.

Boilers.

Locomotive, Flue, Tubular, Upright, Cylinder and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.

Amalgamating Machinery.

Wheeler & Randall's Improved Tractory Curve Pan, Zeuas Wheeler's improved flat bottom pan, Beldin's pan, Veatch's tubs, Prator's concentrators, Wahlee's pans, Boerpan, German Barrels, Arastra Gearing, Chilie Mills, Settlers of all descriptions, Retorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Cams, Pans and Tubs.

BLAKE'S PATENT QUARTZ CRUSHERS, of all sizes.

Oil Boring Tools and Machinery,

Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania.

We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.

Russia Iron Screens, of all degrees of fineness and of all qualities of iron.

All work done in the best manner at the lowest cash prices.

And in accordance with law and an order of the Board of Trustees, made on the 14th day of March, 1866, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of the Company, on the 1st day of May, 1866, at the hour of 2 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

N. C FASSETT, Secretary.

Office, 402 Front street, San Francisco. ap14

George Washington Gold and Silver Mining Company, Silver Mountain District, Alpine County, Cal.—Assessment No. 11.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 10th day of April, 1866, an assessment of one dollar per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, at the Office of the Company only.

Any stock upon which said assessment shall remain unpaid on the 12th day of May, 1866, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the 29th day of May, 1866, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

W. D. ROOT, Secretary.

Office, 338 Montgomery street, San Francisco. ap14

POSTPONEMENT.—The advertisement of stock delinquent on the above assessment, is hereby postponed until Saturday, June 9th, 1866, and the sale thereof until Tuesday, June 26th, 1866. By order of the Board of Trustees.

ap28 W. D. ROOT, Secretary.

Harker Gold and Silver Mining Company, Lander County, Nevada.

NOTICE.—There are delinquent upon the following described stock, on account of assessment levied on the 14th day of March, 1866, the several amounts set opposite the names of the respective shareholders, as follows:

Office, 402 Front street, San Francisco, Cal. ap14

SAVE YOUR MONEY AND BUY,

For $100!

HUNTER'S

Premium Concentrator!!

Awarded a Silver Medal at the Mechanics' Fair of 1865.

THE ABOVE MACHINE HAS BEEN RECENTLY IMproved and simplified, doing away with all complication and friction, thereby requiring less power and speed. As improved, 125 revolutions per minute is the regular speed required, but any speed varying from 100 to 135 revolutions does not change the results. It is the only machine built on the Pacific coast that is perfectly adjustable, for all the different grades of ores, and will save ten per cent. more sulphurets than any Concentrator in use, and is the cheapest, from the following list of prices:

For a single machine of the capacity of five tons in twenty-four hours, as it passes from the battery or pans, $125. For double machines of two, three, or four tables in one frame, each table of five tons capacity, $100.

I have been running machines for the past three months at Grass Valley, therefore I make my assertions from a practical working test, where several of the machines are working. Persons desirous of seeing the machines running, can do so at Empire Mill, Grass Valley, where twelve machines can be seen in operation, or in San Francisco, at 18 Washington street, below Davis, where ALBERT JACOBS will fill their orders promptly.

ANDREW HUNTER,

17v12-tf Inventor.

Keokuk Gold, Silver and Copper Mining Company, Clayton District, Contra Costa County, State of California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 17th day of April, 1866, an assessment of ten cents per share was levied upon the capital stock of said Company, payable in United States gold and silver coin, to the Secretary.

Any stock upon which said assessment shall remain unpaid on the 18th day of May, 1866, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 4th day of June, 1866, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

A. B. WINEGAR, Secretary.

Office, 308 Front street, San Francisco. ap21

Kentucky Copper Mining Company, Mine Felix District, Calaveras County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 2d day of April, 1866, an assessment of one dollar per share was levied upon the capital stock of said company, payable on the 3d day of April, 1866, in United States gold and silver coin, to the Secretary, at his office, 644 Washington street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the 8th day of May, 1866, will be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the 30th day of May, 1866, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. A. BAUER, Secretary.

Office, 644 Washington street, San Francisco, Cal. ap7

And in accordance with law and an order of the Board of Trustees, made on the 10th day of March, 1866, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by Cobb & Sinton, No. 406 Montgomery street, San Francisco, Cal., on Saturday, the 28th day of April, 1868, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

R. WEGENER, Secretary.

Office, 415 Montgomery street, San Francisco. ap14

United States Mining Company.—Location: Virginia District, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 19th day of April, 1866, an assessment of one dollar per share was levied on each and every share of the capital stock of said company, payable immediately, in gold coin of the United States, to the Secretary, at his office, or to Da. T. H. PINKERTON, South B street, Virginia, Nevada

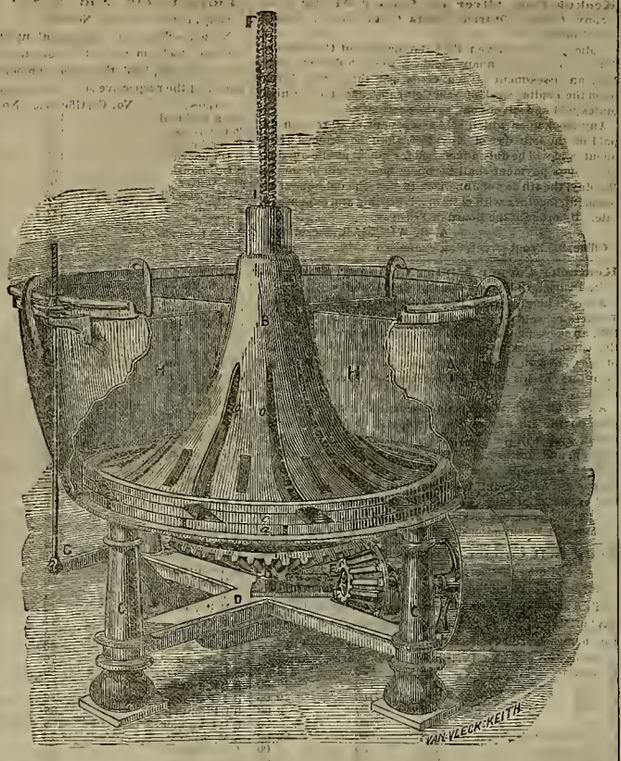
Any stock upon which said assessment shall remain unpaid on Saturday, the 26th day of May, 1866, will be advertised as delinquent, and unless paid, will be sold on Wednesday, the 13th day of June, 1866, to pay said delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. M. BUFFINGTON, Secretary.

Office, No. 10 Government House, corner Sansome and Washington streets, San Francisco. ad21

THE EXCELSIOR
GRINDER AND AMALGAMATOR.

In the engraving herewith presented, A represents the Rim of the Pan; B, Muller; C, Legs; D, Cross-Frame; E, Gearing; F, Screw; G, Lever; H, Dash-Boards; I, Key; *a*, Dies; *c*, Shoes, and *o*, Openings,



The relative grinding capacities of "The Excelsior" Grinder and Amalgamator, of the Flat Bottomed Pan, and of the Conical Pan *when properly constructed*, are respectively 177, 98 and 110.

That is, the respective mullers being of the same diameter, same weight, same hardness, and running at the same velocity "The Excelsior Grinder and Amalgamator" will reduce one hundred and seventy-seven tons of ore, the Flat Bottomed Pan ninety-eight tons, and the Conical Pan one hundred and ten tons to the same degree of fineness in the same time.

The wear to the Shoes and Dies at their grinding surfaces in the Excelsior Grinder and Amalgamator, is perfectly uniform, thus securing evenness of reduction to the pulp, as well as steadiness of motion to the muller. Uniform wear of the grinding plates has been attained in no other than that of the Tractory form—nor can it be.

Another property of excellence in this machine is that the metal or substance to be amalgamated passes *direct* from the grinding surfaces into the quicksilver; thus excluding the possibility of its becoming coated with any foreign substances, after having been burnished. It is truthfully said "that the Tractory-formed Pan as a Grinder has no equal, and as an Amalgamator no superior."

As a whole, it is far superior to any other pan in use.

MANUFACTURED AT THE

Union Iron Works and Golden State Iron Works,

WHEELER & RANDALL, Inventors.

The undersigned having had several years of experience in practical quartz mining operations, will ever take great pleasure in furnishing parties interested in mining and machinery any desired information which they may possess.

Machinery.

"Safety Cages."

(PATENT GRANTED.)

MINING COMPANIES

WILL FIND IT TO THEIR INTEREST TO ADOPT "Berry, Hochholzer & Denver's Safety Cage" in their hoisting works. It requires very little more work to manufacture than the ordinary style of cages—any blacksmith can make it. It has been PROVED TO BE PERFECTLY SAFE, is self acting and very light, and will, in the item of rope alone, pay for itself in a short time.

The proprietors refer to the following mining companies, among others, that are now using this Safety Cage:—Gould & Curry, Savage, Ophir, Mexican, Empire, Overman and Justis.

For particulars and terms, apply to

HUGO HOCHHOLZER,

Virginia City, Nevada,

15v11tf Through Wells, Fargo & Co's Express.

Union Amalgamator.

This Valuable Invention

IS FAST FINDING ITS WAY INTO GENERAL USE, NOT by means of combination of capital and influence, but on the strength of its own merits, and upon the principle that what is known to be good will be appreciated. Practical men acknowledge the UNION PAN to be scientific, the best, the cheapest, and most profitable. It now stands first on the list of all pans in use for the purpose of

Working Gold and Silver Ores.

It has been found that a low class of ores, also tailings from Mills, Sulphurets, etc., that will not pay to work with the common pans, may be worked with this and obtain large profits. The UNION PAN is manufactured in two sizes, and capable of operating upon large quantities of ore in the most efficient manner.

Parties interested in Quartz Mining, Mills, etc., will find it to their advantage to call and examine for themselves, and see its operation.

Gold and silver ores tested by regular mill process, at moderate cost, by

STRONG & CO.,

San Francisco Foundry, corner Mission and Fremont streets, where orders will receive prompt attention.

NEW MINING PUMP.

Excelsior Double-Acting Suction and Force Pump.

W. D. Hooker's Patent, August 15, 1865.

THE SUBSCRIBERS OFFER FOR SALE the following sizes of the above-named celebrated Pump, acknowledged to be the best Double Acting Pump known to be in use. They are more easily set in position, and are more durable and compact than any other Double Acting Force Pump; they are also worked with very little friction, and have greater forcing power than other pumps of like size. They are adapted to work by hand, wind mill, horse, or steam-power.

No. 1—Cylinder 2½ in., stroke 6 in.
No 2—Cylinder 3 in., stroke 7 in.
No. 3—Cylinder 4 in., stroke 10 in.
No. 4—Cylinder 5 in., stroke 15 in.
No 5—Cylinder 6 in., stroke 18 in.

The Nos. 4 and 5 are Mining Pumps.

We have also for sale a full assortment of Pump Fixtures, such as Iron Pipe, Hose, Brass Goods, etc.

VARNEY'S
PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the

Our Circulation.—THE MINING AND SCIENTIFIC PRESS has a large and permanent subscription list, and enjoys a more universal circulation among stockholders and persons directly interested in mining than any other paper on this coast.

[Written for the Mining and Scientific Press.]

From Tuolumne County.

[BY OUR SPECIAL CORRESPONDENT.]

EDITORS. PRESS:—The mines in this neighborhood are so numerous, and the proprietors and superintendents are so obliging and communicative, that my notes are too voluminous to be all transcribed, and I shall have to content myself with a general notice of the various districts *en passant*.

Most of the productive mines in this district are those situated on the "mother vein," as it is here called, or the great range of quartz running through the country from northwest to southeast. The principal mines on this range are the Rawhide Ranch, Golden Rule, and that of Jno. App & Co., noticed last spring.

AT THE RAWHIDE RANCH,

A fine new 20-stamp mill is in course of erection by the present proprietors, who are represented by Capt. Johnston. It is to be driven by steam, the engine used for driving the machinery at the last Mechanics' Fair in San Francisco, having been purchased and sent out for that purpose. Two of Wheeler's flat-bottomed pans are being put in to work sulphurets. The mill is by far the finest yet built in this county. An incline has been sunk on the vein to a depth of 130 feet, a drift 130 feet in length having been run at a depth of 120 feet. The shaft is large and well timbered, and everything about the mine wears an appearance indicative of permanence and reliability. The vein has a dip of thirty degrees to the northeast, and is about twelve feet wide in the lower level. No rock has been crushed since the mine came into the hands of the present owners.

THE GOLDEN RULE COMPANY

Have completed a fine 15-stamp mill, erected since my last visit. It is driven by water-power, furnished by an overshot wheel fifty feet in diameter. I was informed by Mr. A. S. Phifer, the superintendent of the company, that the quartz crushed in the old mill during the past year paid an average of $37.50 per ton, while the expense of mining, hauling and crushing averaged $19.50 per ton. They are now taking out some of the best rock that the mine has ever furnished, and its prospects were never better.

THE MINE OF JOHN APP & CO.

Has reached a depth of 130 feet below the tunnel, and looks better than ever before. It has been paying from twelve to fifteen dollars per ton. The mine has been conditionally sold for $120,000, but Mr. A. expresses the hope that the purchasers will fail to comply with the conditions, as the mine is evidently worth more than that sum.

Half a mile northwest of the Rawhide ranch is the

CHAPPARAL HILL CLAIM,

Consisting of 1,480 feet on the "Mother vein," and is owned by Messrs. Mitchell and Oliver, who have sold it conditionally to Mr. C. T. Meader, at whose expense it is now being prospected. A tunnel has been driven northward from a gulch in the middle of the claim, a distance of 300 feet. Sixty feet from the mouth of the tunnel a shaft is being sunk which is now ninety feet deep. The paying portion of the vein is about three feet wide at the top, while the shaft, six feet wide, is wholly in at the bottom. The croppings of the vein show gold throughout the whole length of the claim. The rock from the bottom of the shaft is looking well. Mr. Meader has, undoubtedly, made a good investment.

North of the Chapparal Hill claim, and adjoining it, is that of

QUINBY & CO.,

Of 1,000 feet. The "pay" is here confined to a stratum on the east side of the vein, which, at the surface, is only about two inches thick, but increases at a depth of forty feet to a thickness of one foot. Ten tons of quartz were lying on the dump, which Mr. Q. informs me has been assayed by Mr. Thomas Price, of San Francisco, and found to be worth $250 per ton.

THE TABLE MOUNTAIN TUNNEL COMPANY,

Have abandoned their old tunnel at Humbug Hill, on account of its inconvenience to most of their ground, and have run a new incline, 1,000 feet northwest of the old one. It is now 551 feet into the mountain, and connects southward with the old works and drain tunnel. The claim has been paying well for the past year.

THE CLAIM OF HESLEP BROTHERS,

At Quartz Mountain, the location of which was more fully described last spring, has been opened to a depth of forty feet, producing rock

of a character very similar to that from the Golden Rule, being principally slate, with thin streaks of quartz. It has paid, as I am informed by Mr. B. F. Heslep, from twelve to fifteen dollars per ton during the past year, and seems to be constantly improving. The thickness of the vein at the bottom of the shaft is about four feet. Negotiations are said to be on foot for the sale of this mine to some San Francisco capitalists, who will proceed at once to open it on a large scale.

Nimmon & Co's mine seems to be in about the same condition as a year ago, the proprietors still failing to agree among themselves, and being all short of capital, work goes on very slowly. I noticed a new engine on the ground, however, ready to put up for hoisting purposes. This will make the working of the mine a much more economical matter.

A side vein, east of the principal Carson lead, was discovered in the latter part of last August by Mr. John Knox. His works are situated about half a mile due south from Heslep's. A shaft has been sunk to a depth of seventy four feet, and a drift sixty feet long has been run, disclosing a vein from four to ten inches thick, dipping to the eastward at an angle of about forty degrees. Several tons of the rock have been crushed at Heslep's mill, paying from $25 to $60 per ton.

THE EAGLE G. M. COMPANY,

Of Blue Gulch, near Jackeonville, and some six miles south of this place, has one of the most promising locations on the Carson lead. Mr. Peter Musser is superintendent, and most if not all of the stock is owned by persons residing in Philadelphia, Pa. This claim is admirably situated for working. A tunnel 125 feet long, run by former owners of the mine, opens the vein at a depth of 112 feet. North of this tunnel is a chimney of rich ore about three feet wide and 175 feet long. The chimney south of the tunnel has been worked out down to the level of the tunnel; but the indications on the surface would seem to show that it was about 200 feet long. At the end of the tunnel a chamber has been excavated of sufficient size to accommodate a "whim," and Mr. Musser has sunk a shaft on the vein to a depth of ninety feet. The first quartz was struck at a depth of thirty feet, and in the bottom of the shaft the vein is three feet wide, yielding as fine quartz as I ever saw, estimated by Mr. M. to pay fifty dollars per ton. The walls of the vein are very smooth, and well defined, giving strong evidence of the permanency of the vein. The company own an excellent water-power, and have erected a very good 10-stamp mill, driven by an overshot wheel of forty feet in diameter.

About a mile and a half southeast of the Eagle, and near the town of Placerville, is the mine of the

OHIO COMPANY,

Of New York, Mr Kelly, superintendent. The vein has been opened by a tunnel 400 feet long on the "lead," and to a depth of 100 feet below the surface. The tunnel is connected with the surface at its northwest end by an air shaft; while at a distance of 250 feet from the mouth Mr. K. has begun to sink below the tunnel. At this point, the three veins, which together constitute the Carson lead, seem to come into one. The best paying portion is on the eastern wall, and is about four feet thick, and is estimated by Mr. Kelly to pay from nine to twenty-five dollars per ton—average, ten dollars. The mill of ten stamps is driven by a wooden turbine wheel, which does not seem to work well. Two of Prater's concentrators are in use, and two of Knox's pans. Everything about the mill, except the power, seems to be very good.

Business at Sonora, and, in fact, throughout the upper part of the country, is very dull, especially at this season of the year. One of the institutions which is still doing a good business in spite of the dull times, is the

SONORA FOUNDRY,

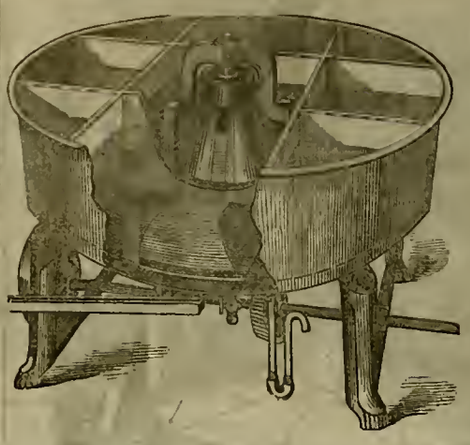
Owned by Messrs. Phelps and Cowie. The machine shop is 45 by 65 feet, and contains two horizontal lathes, one capable of turning a shaft of two feet in diameter, and the other one of twenty-two inches diameter, and nineteen feet long, one upright lathe of six feet in diameter, two drilling machines and a planing machine, with plate twenty-six inches wide by six feet long. The furnace is capable of melting 5,000 pounds of iron daily. The fire-proof room for the storage of patterns is 30 by 35 feet; pattern-shop 45 by 65 feet. The blast and machinery are driven by water-power.

The past week I have spent principally in the mountains above Sonora and Columbia, where I visited a large number of mines, some of which are equally worthy of notice as any of those above mentioned, but want of space compels me to defer the matter. Among those especially deserving of note, are the Consuelo and Bonita on the North Fork of the Tuolumne, three miles south of Summersville, the Independence, the Comstock, and the Excelsior and Mount Vernon at Sugar Pine, fifteen miles East of Sonora, all of which I hope to be able to describe in a future letter. D.

Jamestown, April 7th, 1866.

Knox's Improved Patent Amalgamator and Separator,

With Palmer's Patent Steam Chamber or Die.



THIS CUT REPRESENTS AN AMALgamator and Separator that has stood the test of EIGHT YEARS' practical working in the gold mines of California, and for nearly the same time in the silver mines of Nevada, having been introduced into the first steam mills built in the then Territory, since which time they have been successfully working against all competition.

The great advantages these Amalgamators have over any others, are—

1st. **Much less Cost.**

2d. They do not "flour" the mercury, and collect any that may have been "sickened" in the battery or grinders.

3d. The "sloshing" motion given to the pulp (by the revolution of the muller under the stationary frame) against the amalgamated copper plates that are fastened to the frame, and by this means catching the fine gold and mercury that will not settle.

4th. The gate in the cone, through which the pulp is discharged, from the top, and where there is the least motion, almost precluding the possibility of any granulated mercury or fine gold escaping.

There are over 500 of them in use in California and Nevada, where those interested can see their practical workings.

For further particulars, inquire of ISRAEL W. KNOX, OR W. A. PALMER, Inventors,

14v13-p12q At the Golden State Iron Works, No. 19 First street, San Francisco.

Portable Steam Engines!

"Hoadley's" and "Hittinger's" Make,

COMBINING THE MAXIMUM OF EFFICIENCY, Durability, and Economy, with the Minimum of weight and Price.

These Engines are favorably known, a large number being in use on this coast for hoisting, pumping, threshing, milling and mining purposes.

Steam can be got up on these Engines in fifteen minutes after reaching the place of operation, and the time, expense of setting boilers, machinery, and "construction account" saved, (which is often the difference between the successful and unsuccessful prosecution of milling enterprises,) in fact, the portable principle is the pioneer's friend, and enables him to draw engines on their own wheels to his cabin door, and plant on the outermost confines of civilization the saw and grist mill, and it has done and will do more to help subdue the continent than any other of the modern motors which are crowding society and normalizing the world.

All sizes on hand from 3 to 30 horse power, with and without carriages.

Also, Portable Saw and Grist Mills.

For sale by TREADWELL & CO.,

3v12-3m Corner of Front and Market streets.

THE PRESS is a large, sixteen page paper, and is truly a valuable assistant to the mining interests of the Pacific Coast.—[Nye County News.

BAUX & GUIOD'S Separator & Amalgamator

Is the most important improvement in mining machinery ever introduced. It was awarded the FIRST PREMIUM at the San Francisco Mechanics' Fair for 1864, where it proved itself to be the best Separator and Amalgamator among all the competitors. Constructed on principles which combine SCIENTIFIC KNOWLEDGE WITH PRACTICAL EXPERIENCE, these Pans extract more gold and silver from their ores than any others in use, as a few hours trial will demonstrate. Mill men will find it to their advantage to employ these pans as Separators, in addition to the ordinary Amalgators now in use, and to re-work their old tailings.

The cost of these pans is inconsiderable, and their structure is such that they can be readily separated in parts convenient for packing on mules. Among the many advantages possessed by BAUX & GUIOD'S Pan, are the following: The trifling cost for attendance; its small cost; its portability; The large quantity of pulp it can operate upon in a given time; It may be worked even weeks without stopping, as it is constructed to work continuously; The complete thoroughness of the separation of the rock from the metals and the trifling power required to work them; They can be attached to any ordinary crushing apparatus.

We have the pleasure of referring parties interested to the following parties, who have our Pan in use: Jefferson-lan Mining Company, Bowman's Ranch, Nevada county; The French Mill, Nevada City; Graff's Gravel Cement Works, Nevada county; Waltman's Chlorination Works, Nevada, Cal.; Gold Hill Quartz Mill, Washoe.

Manufactured at the Vulcan Iron Works and San Francisco Foundry, San Francisco, and at Heugh & Thom's Foundry, Nevada City.

For further particulars, or to see this Pan in operation, call on or address J. B. BAUX,

Fremont Street, near Mission, adjoining the San Francisco Iron Works, San Francisco. 4v8-6df

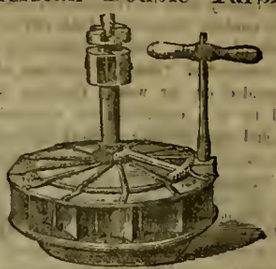
LEFFEL'S

American Double Turbine WATER WHEEL.



THIS WHEEL, WHICH HAS HAD THE most unprecedented sale of any water-wheel ever made, and which has given unusual satisfaction wherever used, is now for sale by KNAPP & GRANT, 310 Washington street, San Francisco, where persons desiring to use water-power can be supplied. These Wheels are adapted to use from 10 to 5,000 inches of water, and from 4 feet to 300 feet fall; Let us know how much water you have either in miner's inches or cubic feet per minute, what fall you have, and what power you require. Write or send for circular to

KNAPP & GRANT,

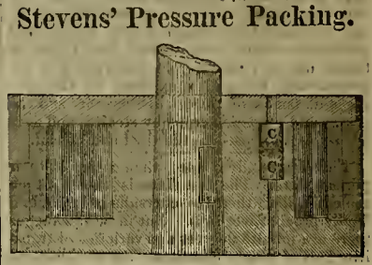
—ALSO— San Francisco.

Leffel's Lever Jacks,

For railroads, cars, or wagons; Railroad Jacks for engines and cars; Track Jacks for leveling, with which three men, with a pair of these Jacks, can level more track in a day than twelve men working in the ordinary manner; also, Track Jacks, for relieving the axle of pressure to replace the brass. These Jacks are now in general use in the Eastern States, and give entire satisfaction. Also, Wagon and Track Jacks of the most superior make and kind. For sale by KNAPP & GRANT,

12v12-3m San Francisco.

Stevens' Pressure Packing.



Patented March 7th, 1865.

Pressure Packing is now conceded, by the best engineers, to be the most effectual method of making and keeping the metallic ring of PISTONS steam-tight.

STEVENS' PACKING has the advantage of being cheaper in first cost than the ordinary packing, and can be applied to old style pistons with very little alteration or detention. In place of testimonials, the Patentee requests of those who are using the old spring packing to inquire of the owners of the various engines which now have this packing in use—some of which have been running from three to twelve months without being opened, or showing any descriptive leak—and act upon their recommendation.

Further particulars can be had by applying to the Patentee, ANDREW STEVENS, Master Mechanic, Alameda Railroad, or at the VULCAN IRON WORKS, where they can be seen, at any time, in course of construction.

10df ANDREW STEVENS.

Six-Inch Mining Pump.

CALIFORNIA MADE CLOTHING.—The proprietors of Quiocy Hall, on Washington street, are rapidly clothing the people of this city io cloth of California make. Their description of clothing is innocent of "shoddy," and can nlways be depended on for wear. Clothing is furnished by this establishment wholesale or retnil, and made to order at the shortest notice. Californians should on all proper occasions make it a point to support home manufactures.

THE PROPOSED TUNNEL BETWEEN ENGLAND AND FRANCE.—Eastern papers state that a report is current at Paris that an agent from some heavy capitalists and contractors, who propose to establish a tunnel under the sea, from Dover to Calais, bas arrived in Paris. The agent, it is said, is commissioned to apply to the Emperor for permission to make borings on the French soil, in order to ascertain the practibility of the scheme.

SYRIAN AORICULTURE.—The "Holy Land," so fruitful in the days of the chosen people, is now neglected. The land is for the most part fertile, and might be profitably cultivated, were it not for the disfavor with which agriculture is regarded by the government. The implements employed in tilling the soil are very rude, being, in fact, the same as those used io the days of Abraham, Isaac and Jacob. Still, even with this cultivation, the crops are large, affording evidence of how much larger enlightened cultivation might make them. The *fellah* or farmer not only suffers from the tyranny of the governmeot, but is also exposed to the outrages of bands of roviog Bedouins; and he plants and reaps his crops by stealth, and only where least exposed to the thief and official.

FEW insects live more than a year in their perfect state. The first state is the egg, then the caterpillar, then the chrysalis or pupa, and finally procreative form. But io these changes there are iofinite degrees and varieties of transition, all of which coostitute the pleasing and very instructive study of entomology.

CALIFORNIA
BUILDING AND LOAN SOCIETY

Removal Notice.

THE DIRECTORS OF THE CALIFORNIA BUILDINO AND LOAN SOCIETY, announce to the public the removal of their business to their

NEW BANKING HOUSE,
California Street, one Door from Sansome.

LOANS.

The Directors propose an extension of their Banking accommodation to the assistance of—
First—The Purchase of Real Estate.
Second—The Erection of Houses.
Third—The Erection of Manufactories.
Fourth—The Building of Sea and River Vessels of all sizes.
Fifth—Mercantile Cash Credits on the Scottish principle, for such time as may be agreed upon.

Under the above general heads, loans will be made for terms of years to correspond with the requirements of parties upon the security of REAL ESTATE, BUILOINGS, SHIPS and MERCHANDISE.

MONTHLY DEPOSITS.

ONE PER CENT. PER MONTH will be allowed on all deposits made at one month's notice of withdrawal.

CURRENT ACCOUNTS.

HALF PER CENT PER MONTH will be allowed on the daily balances to credit of Current Banking Accounts—the same to be ascertained and credited monthly.

REMITTANCES FROM THE COUNTRY
PROMPTLY ACKNOWLEDGED.

INTEREST on all sums commences from the day of deposit.
DEPOSITS of any amount received, from FIVE DOLLARS upwards.

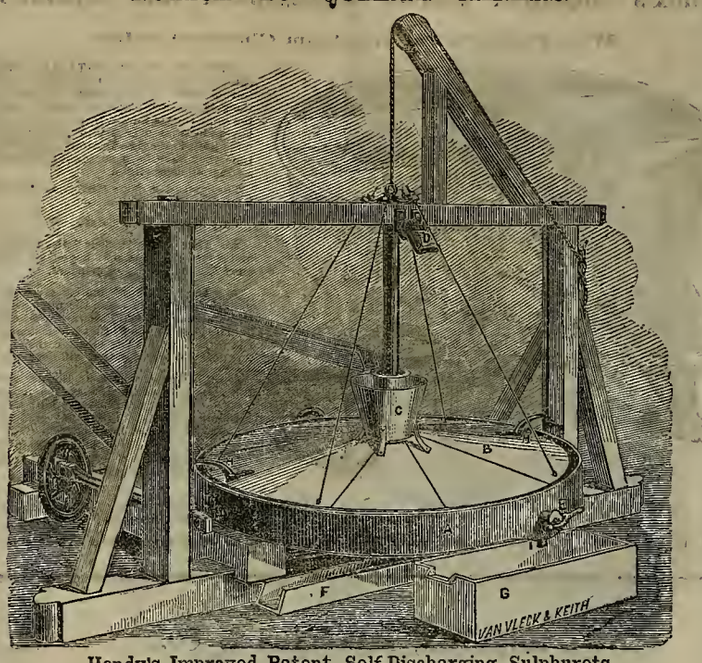
NOTICE TO QUARTZ MINERS.



Hendy's Improved Patent Self-Discharging Sulphurets
PRATER CONCENTRATOR
Is Receiving Universal Favor.

Reference is made to the following Mills which are using the Prater Concentrator, with some of the improvements attached. The Self Discharging Sulphurets has been more recently adapted, and the public attention is called to examine its workings:

STEPHENS' MILL, Humboldt County, Nevada.
CHRYSOPOLIS MILL, " "
U. S. REESE RIVER MILL, Austin, "
UNION MILL, El Dorado County, near Mud Springs.
NEW YORK AND EL DORADO CO., " "
CONEY MILL, Jackson, Amador County.
MESSRS. TUBBS & CO'S MILL, San Andreas, Amador Co.
WINTER'S MILL, Angels Camp, Calaveras County.
CLIO MILL, Jacksonville, Tuolumne County.
CARROL & ASPINWALL MILL, Reese River, Nevada.

And in use in other parts of this State; also in Idaho, Arizona, Colorado and Mexico.

As a further evidence of its worth, orders have been received recently from the proprietors of the following mills, all of whom are using these Concentrators, or have works in the immediate neighborhood of mills using them, viz.:
One Concentrator ordered for the Coney Mill, Jackson, Amador County, by Messrs. Bigclow & Bro., of this city.
Three Concentrators for the Spring Hill Mill, Volcano, Amador County.
Two Concentrators for the Golden Gate Mill, Volcano, Amador County.
Four Concentrators for the Raw Hide Ranch Mill, Sonora, Tuolumne County.
Six Concentrators for the Benton Mill, Bear Valley, Mariposa Co. ordered by Messrs Dodge & Bro, San Francisco.
They may be seen in operation at the GOLOEN STATE FOUNDRY, No. 18 First Street, San Francisco.

CAUTION.

TO WHOM IT MAY CONCERN:—THE PUBLIC ARE hereby notified that a patent was allowed, December 27th, 1864, and issued June 27th, 1865, to PROFESSOR HENRY WURTZ, for the use of sodium and amalgams thereof with quicksilver, in the extraction of precious metals from their ores. All persons using said amalgams, or purchasing or selling sodium or said amalgams for use in the treatment of gold or silver ores, are hereby cautioned that they will be prosecuted to the full extent of the law.

The patents of Professor Wartz have been assigned to the Wurtz Amalgamation Company of New York city. It is the intention of the said company soon to appoint agents for California and the other mining States and Territories. In the meantime, applications for licenses to use sodium and its amalgams may be addressed to the company, at their office, No. 57 Broadway, New York.

C. ELTON BUCK, Secretary.

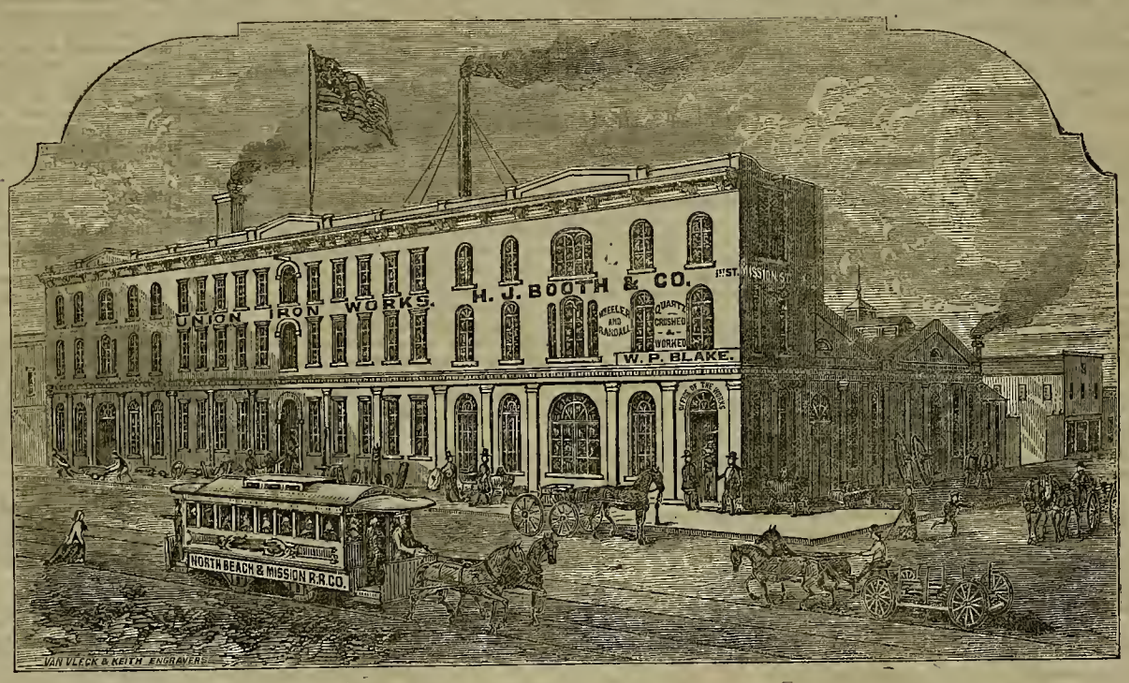
THE UNION IRON WORKS.

The engraving which we here present ta our readers is an excellent representation of the most extensive foundry and machine shop yet established upon this coast, and one which will bear a favorable comparison in its various appointments with any of the iron shops in the older cities of our Union. These works are situated on First street, but a few steps from the very center of our flourishing city. During the past year an important addition has been made ta these buildings, as shown in the illustration. In giving the view of these buildings, we have deemed it a fitting season, and a matter of interest ta our readers, to accompany the same with some information regarding the owners and parties connected therewith.



The Union Iron Works were founded early in 1849, by Messrs. James and Peter Donahue, and consisted of a small rude furnace and a few inferior tools, unprotected from sand and storm. The furnace blast was produced by two blacksmith bellows. At these works, soon after their commencement, was made a "steady or spring bearing" for the ocean propeller McKim. This was the first *iron casting* turned out on the Pacific Coast, and was made at fifty cents a pound. It may now be seen at the Mechanic's Institute, California street. Here among the sand hills of San Francisco, the Donahue Brothers built up a large business, and laid the foundations of their princely fortunes. From time to time they enlarged and improved their establishment in its various departments, evincing the determination to keep it in advance of other similar works which sprung up around them. In 1856, James sold his entire interest in the property to his brother Peter, who immediately built of brick a large and commodious machine shop and foundry on the site of his roofless workshop of 1849, and carried on the business in his own name. At this time the works occupied an area of upwards of fifty thousand square feet.

Mr. Donahue, however, being eminently a representative of Californian and of his country's interests, engaged in City, State and National enterprises so extensively that he was unable to exercise much personal supervision over the mechanical branch of his business, which, in consequence, and through incompetent agents, fell off greatly.

In 1863 he formed a copartnership with H. J. Booth, of the Marysville Foundry, and C. S. Higgins, formerly of Freeman's Express, under the name and style of Donahue, Booth & Co. Mr. Booth had carried on the foundry business in California with marked ability and success about twelve years. No well-known citizen was more highly respected throughout the country. He brought to the firm an enviable reputation as a man of enterprise, talent and probity—an excellent financier and a thorough mechanic. Mr. Higgins was also well known as a gentleman of active business qualifications. But jealousy as to supposed rights and real or imaginary conflicting interests prevented that harmony among partners so necessary to success; and the firm in consequence failed to resuscitate the business. In 1865, Donahue, Booth & Co. sold their interest to H. J. Booth & Co., a new firm composed of H. J. Booth, G. W. Prescott and I. M. Scott.

Mr. Prescott, since 1859, has been a partner of Mr. Booth in the Marysville Foundry,—one of the largest and most successful establishments of the kind in the State,—of which at present he is the manager. We regard him as a gentleman of sound judgment, unswerving integrity, and ripe experience in all things relating to his vocation.

Mr. Scott came to California in 1860, and until the past year followed his profession of draughtsman, exercising, as we are informed, at the same time a general supervision over the work where he was engaged. He bears an unblemished reputation. If, on becoming a member of the firm of Messrs. H. J. Booth & Co., he had comparatively little capital, he brought to the concern that which is much better—energy, mechanical talent and an excellent executive capacity. The new firm, Mr. Booth attending to the contracting and financial department, and Mr. Scott to the mechanical, had had control of the Union Iron Works but a few days, when the change was apparent in the new life exhibited in every department of the establishment. Every tool and working machine was soon found in operation day and night. The press of work became so great that several other machines larger than any hitherto used on the Pacific coast, were imported. With twenty-three lathes of various sizes, from nine feet swing and thirty-four feet long, with double heads, to twelve inch swing; eight planers, some working six and a half feet square and twenty-six feet in length, with double heads; twelve drills; several gear cutters; boring mills and slotters; one fifteen around him. "You know your duty, do it or leave—a mistake is inexcusable." Illustrative of their sagacity in the selection of foremen, may be mentioned the name of Mr. Wm. R. Eckart, their chief draughtsman. Not only is Mr. Eckart most highly accomplished in his profession, and in analytical and practical mechanics, but he possesses inventive power in an eminent degree.

His Steam Pump, Smut Machine, Portable Engine, Fan, Cut-off Valve Indicator, and the Balance Valve Cut-off Engine, and Slide Valve Cut-off Engine, of Scott & Eckart, are of the highest practical importance. At the Mechanics' Institute Fair, in San Francisco, 1865, two medals were awarded to Mr. Eckart: one of silver, for his Cut-off Valve Indicator, and one of gold, for the Slide Valve Cut-off Engine, of Scott & Eckart. This Engine, manufactured by Messrs. H. J. Booth & Co., both as to design and construction, is a machine of which California may well be proud. One of the same design and about one hundred horse-power is employed by the Company to run their works.

But with Messrs. H. J. Booth & Co., the manufacture of steam engines is not a specialty. It may rather be inferred from the quantity of work done at their establishment, and from the amount of their correct data and valuable information obtained from the most reliable sources, relative to the comparative merits of the mining apparatus in use, that Quartz Machinery receives more of their special attention. Since the formation of their copartnership—Mar. 16, 1865—they have manufactured two hundred and twenty stamps, ninety-seven grinders and amalgamators, and forty-four separators, besides a large amount of other quartz machinery.

Among the machines of their manufacture, they make special mention of the Excelsior Grinder and Amalgamator, and state that its practical workings fully confirm the demonstrations of Mr. Randall, as published in the "Quartz Operator's Hand Book," and that it appears to be supplanting other grinders and amalgamators.

The Union Iron Works not only excels in the manufacture of steam engines and quartz machinery, but is the heaviest establishment in the manufacture of all descriptions of machinery needed on the Pacific Coast. The proprietors are enabled by their extra facilities, judicious selections, and the perfect system running through the various branches of their business, to accomplish a much greater amount of work per man than any ordinary establishment. *Quality*, rather than *quantity*, is claimed to be their constant motto, and as evidence to this, they refer with much satisfaction to the superior workmanship of each job leaving their establishment.

By the recent change, the School session for children under eight years of age, is limited to four hours a day,—a very wise provision.

Communications.

In this Department we invite the free discussion of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

From Tuolumne County.

BY OUR SPECIAL CORRESPONDENT.

[Continued from page 271.]

Editors Press: Since my last writing, my notes have grown so numerous and extensive that it is almost a matter of impossibility to include them all in a letter of reasonable length, so I hope that many of those whose mines I have visited within the past few weeks will kindly excuse me if they should not find so extensive a notice as they deserve.

On the 9th inst., I took dinner with Mr. Musser, of the Eagle, on my way from Jamestown to Big Oak Flat. Some very fine new developments had been made since my previous visit to this mine, and I was delighted with the improved appearance of the vein; Mr. M. entertaining, and justly too, very high hopes for the future richness of this mine.

I arrived about dark at the "Flat," where I found about the same state of things as last year, only a little duller. Some improvements, however, have been made. Among these is a fine new 10-stamp mill, nearly complete, at the lower end of the "Flat," nearly on the site of one that was burned down a few years since. The Nonpareil mill, at Deer Flat, was idle for want of quartz. Mr. Dupat was busy experimenting with some tailings, by making them into bricks, and baking them in a kiln, after which they are ground in a Farrand's Amalgamator. The amalgamator was running at the time of my visit, but Mr. Dupat did not feel certain of the practibility of the process.

A fine ledge of decomposed quartz, paying twelve to sixteen dollars per ton has been discovered, and is being worked by Messrs. Foote and Burns, near Garrote. The ledge appears to be about forty feet wide, and has been opened by a shaft to a depth of sixty feet. The rock is crusbed dry under the stamps to the fineness of peas, after which it is ground and amalgamated in Varney's pans, three of which are in use.

Another fine well-defined lead situated between Big Oak Flat and Garrote, is owned by Messrs. Snow, of Garrote and Schermerhorn of the "Flat." About 140 tons of ore are now on the dump, which prospects at about the rate of tbirty dollars per ton.

BOWER CAVE.

On the 11th, I stopped at the Bower Cave, on the North Fork of the Merced, and at the request of the proprietor, Mr. Pechard, visited this highly interesting natural curiosity. The cave is situated about 400 feet from the creek, and at an elevation of probably 100 feet above it. It is in a limestone formation, and consists of an open depression about fifty feet deep and about the same distance across, communicating with which on the east side is a subterranean chamber of nearly the same size. A pool of beautifully clear water occupies about half the surface of the bottom of the main depression, while some maple trees, shading the cavern from the rays of the sun, suggest to the mind an amount of enjoyment in the way of summer picnics, not to be found everywhere. The cave is said to have been lined at one time with very fine stalactites, but these have long since disappeared before the throngs of curiosity-seeking visitors who have been attracted thither for the past ten years. Near the cave Mr. Wm. Wright of Coulterville is engaged in building a small quartz mill, to work rock from a vein which he told me was situated about a mile above. In the afternoon, I visited the mine of

BLACK, MUNN & CO.,

Situated near Black's store, about fifteen miles east of Coulterville. The course of the vein is about north and south, with a dip to the eastward of about forty-five degrees. At the time of my visit, the pumping works were out of order, and the mine was nearly full of water. Mr. Munn, however, informed me that the shaft had reached a depth of 160 feet on the vein. The vein near the surface is very much broken, being but little more than a range of quartz boulders, lying between the slate bedrock and the alluvium, which last formation constituted the hanging wall. Mr. M. says that in the bottom of the shaft the vein is solid and about two feet wide. The last crushing is said to have paid forty-five dollars per ton, the rock being taken from the bottom of the present shaft. The pump and hoisting gear are driven by an engine of 10-horse power, and everything goes to sbow that the owners are in earnest in their intention to test the value of the vein.

After returning to Mr. Black's, a ride of three and a half miles brought me to

THE MARBLE SPRING MINE,

Owned by Messrs. Coward, Ralston and Wakelee, of San Francisco. This mine had paid well in former years, but for some time since had been abandoned, until it fell into the hands of the present proprietors, who are going vigorously to work to reopen it. The vein as far as heretofore explored, has been from one to three feet wide, running in a northeasterly and southwesterly direction, with a dip to the southeast of about thirty-two degrees. At the request of Mr. Thomas Armstrong, the superintendent of the mine, I spent the night with him, and in the morning started for Coulterville, stopping for a short time with Mr. W. G. Heslep, formerly of Quartz Mountain, Tuolumne county, who is now working

THE LOUISIANA MINE,

Of which several notices have already appeared in the Press. The vein appears to be from three to six feet wide, about two feet of which is pay rock, assaying from thirty to forty dollars per ton, but of so particularly rebellious a character that it is with some difficulty that even twelve dollars is realized by ordinary process. Mr. H. has lately been trying a *roasting* process, but has thus far been unable to make it work satisfactorily, as the gold in the roasted ore refuses to amalgamate. He expects, however, to give the furnace another trial. Mr. Heslep is well known as one of the most thorough and scientific prospectors in the southern mines, and will probably succeed if any one can.

After dinner I rode down to Coulterville, a distance of about twelve miles, where I arrived a little before night. Coulterville is very dull at this season, and more than usually so, just now.

In the morning, our old friend Capt. Aiken accompanied me on a visit to his claim, known as

THE VIRGINIA,

Situated about two miles southeast of town, on the great Carson lead. A very elaborate report on this vein by Mr. J. E. Clayton, M. E., of San Francisco, was noticed in the Press some time last fall. Subsequent developments more than justify the most sangnine statements in that report. After dinner, I left for Bear Valley, where I arrived a little after dark Saturday and Sunday were spent in Bear Valley, resting from the fatigues of my mountain ride, and obtaining such information as was to be had concerning matters of interest, and a few subscribers to the Press.

THE MARIPOSA ESTATE.

Matters on the Mariposa estate are in a rather precarious condition. The lease of the Dodge Bros. expires in a few weeks, and it is not known whether they will renew it or not, as a consequence of which the employees are generally in anything but a settled state of mind.

In the Benton mills, twenty-four stamps are running on very good rock obtained from a new discovery in the Pine Tree mine, while the Bear Valley mill is supplied from the Josephine. The Princeton is barely paying expenses and a little over, by removing the pillars from the old works. By this means, enough gold has been taken out to pay all the workmen about the mine, and some $3,000 over. No new explorations are going on in this mine, and it is believed that it cannot be reopened at a less cost than $50,000. The Mariposa mill is running a small portion of the time, the miners having leased the mine and mill. The last few runs have not paid more than half wages, while the men regard their back pay as "gone forever." The Mt. Ophir and Greene's Gulch mills have been stopped for months, and part of their material has been removed and sold.

On Monday morning I went in company with Mr. Quierolo, of Bear Valley, to visit the quartz mines of Hunter's Valley. Our first visit was paid to

THE LAFAYETTE VEIN,

Owned by several citizens of Bear Valley. The claim consists of 4,000 feet on a vein running nearly north and south, and dipping eastward at an angle of forty degrees. The deepest opening is by an incline on the vein ninety feet deep. A vertical shaft is being sunk to cut the vein at a perpendicular depth of seventy feet. This is intended for a permanent working shaft, and is large and well timbered. The vein is in slate formation, and is rather irregular in thickness. Its average throughout the old works is probably eighteen or twenty inches, and it has paid the former owners from $20 to $500 per ton. The president of the company is Mr. Samuel Miller, of Bear Valley, who is also superintendent of the works, which latter are now, however, in charge of Mr. H. C. Treon, a practical miner, and one who seems to be giving the best of satisfaction to his employers.

Leaving the Lafayette, we proceeded to the La Victoire copper mine, where Mr. Q. having business he remained while I passed on in company with Mr. Smith, who proposed to act as my guide to the other mines in the Valley. I obtained from Mr. d'Artigue, superintendent of La Victoire some facts concerning the developments of that mine, but as I had no opportunity of exploring the mine, I shall defer a notice of it until such an opportunity shall occur. One and a half miles north of La Victoire, is

THE CARSON AND BARNETT GOLD QUARTZ MINE,

Owned by the gentlemen for whom it is named, and worked under the immediate charge of Mr. Wm. R. Carson. The mine contained so much water that it was impossible to explore the underground works, but Mr. C. informed me that it had been opened to a depth of sixty feet, showing a vein about a foot wide, lying in a north and south direction, with a slight dip to the westward. They have a 6-stamp mill, driven by a 12-horse power steam-engine, which also runs the hoisting works and pump. The rock taken out thus far is said to average $125 per ton. A little farther on we came to the

POTT'S VEIN,

Formerly owned by Mr. Potts, who has sold it, conditionally, to Mr. P. Hussey, of Hornitos, who is now prospecting it. The course of this vein is northeast and southwest, and its width about four feet. It has been opened about ninety feet deep, and has heretofore paid from $70 to $110 per ton, the rock being worked in Floyd's mill. This mine and the Floyd—noticed last year—are under the charge of Mr. d'Artigue, of La Victoire. The latter mine has also been sold, conditionally, to San Francisco parties, for $20,000. The buyers are now prospecting the mine, and have opened it to a depth of 115 feet. The last crushing is said to have paid $75 per ton.

Several other veins in the valley are being prospected with every prospect of success; among which may be specially noted the Mammoth, owned by D. Jones & Co., which is opened to a depth of twelve feet, showing a vein two feet wide, much of the rock showing free gold. About three o'clock we returned to the LaFayette, where we found Mr. Quierolo, and bidding Mr. Smith a pleasant good-bye, we rode back to Bear Valley, well pleased with our ride and its results.

On the following afternoon I left for Colorado, spending the night at Sherlock's. In that neighborhood are a number of mines, principally owned by Chilenos and Italians, some of which would be well worthy of notice; but as my letter is already growing long, I shall have to omit them. The mine of

E. B. ROLLINS & CO.,

On Sweetwater, has been worked by the present owners about four years. It is situated in a granite formation, the strike of the vein being northwest and southeast, with a dip to the northeast of seventy degrees. Its average breadth is from twenty to twenty-two inches, as far as explored. It is opened by an incline 125 feet deep, and by drifts and tunnels on the vein 525 feet. The usual yield is from sixteen to twenty dollars per ton, though some rock has been obtained that paid as much as $250. A 50-horse power steam engine furnishes power for the mill of sixteen stamps, and for pumping the mine and hoisting the ore. The mill is well built, and usually crushes from twelve to sixteen tons in twenty-four hours.

About half a mile above the Rollins' mill is the Ellis mill, of ten stamps, which has been stopped during the past winter, but is now being refitted, and will be started in about a week. After leaving the Ellis mill, Mr. Rollins accompanied me to visit the newly-discovered vein of the

EUREKA QUARTZ COMPANY,

Situated about three miles above Lovejoy's mill, and fifteen miles from Mariposa. We were accompanied to the mine by Mr. Snyder, one of the owners, at whose house I am now staying. The ledge is in a slate formation, running nearly north and south, with a slight dip to the west. It has been opened to a depth of thirty-five feet, and appears to be valuable. Its thickness is from sixteen to thirty-six inches, probably averaging two feet.

To Mr. Snyder, my present host, I am under deep obligations for his kind hospitality, on the occasion of my being caught, when here last spring, in a severe snow-storm. The appearance of things here is much changed since then, and this, which I then regarded as one of the dreariest regions on earth, now appears, in its spring dress, one of the loveliest spots in California. Yours, wanderingly, D.

Mariposa, April 19, 1866.

NEW MINING LAWS.

[Under this caption we shall give, from week to week, several of the different laws relating to Mining, published in our cheap edition of the "New Mining Laws of California and Nevada, passed in 1865-6.]

Chap. LXI.—An Act concerning the Location and Possession of Mining Claims.

[Approved February 27, 1866.]

The People of the State of Nevada, represented in Senate and Assembly, do enact as follows:

Section 1.—Any six or more persons, who are males of the age of twenty-one years and upwards, holding mining claims in any mining district, or who hold mineral lands not within the boundaries of any established mining district, may form a new mining district, embracing said claims, at a meeting of such persons to be called by posting, for five days, in at least five conspicuous places within the limits of such proposed new district, notices, in writing, stating the place and time for holding such meeting, describing, as near as may be, the limits of such proposed new district, and signed by not less than five of such persons. At said meeting all males of the age of twenty-one years and upward, holding mining claims, or any interest therein, within said limits, may vote, and by a majority vote determine whether said new mining district shall be established, and its boundaries, which shall be within the limits named in said notices; and thereafter the persons so qualified and holding mining claims in such newly established district, shall proceed to select a name therefor and elect a District Recorder, who shall be qualified, as aforesaid. He shall perform all the duties required of him by law, and shall, within thirty days after qualifying, file and record in his office, a record of of the proceedings of said meeting. No district formed under the provisions of this Act, shall be divided by any county line. Mining districts now existing may be continued.

Sec. 2. The District Recorder, so chosen, shall hold his office until the second Saturday of July then next ensuing.

Sec. 3. The annual election for District Recorder shall be held, in each district, on the first Saturday of July, of each year. Whenever a vacancy occurs in the office of District Recorder, by death, resignation or otherwise, such vacancy shall be filled, for the balance of the unexpired term, by special election, which shall be called by means of notices, signed by not less than five claim holders entitled to vote for District Recorder in the district, posted in not less than five conspicuous places in the district, for ten days preceding such special election. The District Recorder shall, in all cases, hold his office until his successor is elected and qualified. It shall be the duty of the District Recorder to give notice of the annual election, by posting notices in not less than five conspicuous places in his district, ten days before said election. All notices of election shall state the place, day and hour of holding the election. The District Recorder, in the several mining districts of this State, shall give notice of the first annual election under this Act. In all cases, in posting notices required by this Act, if practicable, one of said notices shall be posted on the door of the District Recorder's office, and, so far as possible, all elections shall be held at the office of the District Recorder.

Sec. 4. All elections, after the first election, in a new district, formed under this Act, shall be by ballot. Except at the first election in a new district, formed under this Act, none but males, of the age of twenty-one years and upwards, who are holders of claims, or any interest therein, in the district, and who have resided in the district thirty days immediately preceding the day of election, shall be entitled to vote. If the district has not been organized for thirty days, then only such persons who are of the age of twenty-one years and upwards, and who own claims, or any interest therein, in said district, and have resided therein from the time of its organization, shall be entitled to vote.

Sec. 5. At eleven o'clock A. M. of the day of election, and at the place designated for holding the same, those entitled to vote at such election shall choose, *viva voce*, one person to act as Inspector, and two persons to act as Judges, all of whom shall be persons who are entitled to vote at such election. The Inspector and Judges shall appoint two suitable persons to act as Clerks at such election. Immediately thereafter the polls shall be opened, and shall be kept open until sundown, at which time they shall close. The person receiving the highest number of votes shall be declared elected District Recorder of the district, and the Inspector and Judges shall give him a certificate to that effect, which, within thirty days after such election, shall be filed and recorded in the office of the District Recorder by the District Recorder.

Sec. 6. No person shall be eligible to the office of District Recorder in any district unless, at the time of the election, he is entitled to vote for District Recorder in such district.

Sec. 7. Any officer of any election who shall be guilty of fraud in the conducting of any election for District Recorder, and any one who shall knowingly cast an illegal vote, shall be deemed guilty of a misdemeanor, and, on conviction, shall be punished by a fine not exceeding one thousand dollars, or imprisonment in the county jail for a period not exceeding six months, or by both such fine and imprisonment.

Sec. 8. In case of a continued absence from the district of the District Recorder and his deputy, for thirty consecutive days, his office may, upon the written application of any five persons who are entitled to vote for District Recorder in the district, be declared vacant by any Justice of the Peace in the county.

Sec. 9. Every District Recorder, including those elected under district mining laws, upon retiring from his office, shall hand over to his successor, all moneys, books, papers and records, of

whatever kind, belonging or appertaining to said office.

SEC. 10. In case the District Recorder of any district wishes to resign his office, he shall file his resignation in the office of the County Clerk, who shall, forthwith, in any reasonable manner, notify the people of said district of the vacancy thus caused.

SEC. 11. The District Recorder shall appoint a deputy, for whose official transactions he shall be responsible, on his official bond. The certificate of such appointment shall be filed and recorded in the office of the District Recorder, by the District Recorder, before said deputy enters upon the discharge of his duties. Said deputy shall, under the direction of the District Recorder, do all things required of the District Recorder; and he may hold his office during the pleasure of the District Recorder.

SEC. 12. The District Recorder, elected at any annual election, shall, if qualified, enter upon the discharge of the duties of his office one week after his election. He shall hold his office for one year, and until after his successor is elected and qualified. Any Recorder elected at a special election, or at the first election in a new district, formed under this Act, shall enter upon the discharge of the duties of his office as soon as qualified.

SEC. 13. Each District Recorder, before entering upon the discharge of his duties, shall take the constitutional oath of office, before some officer authorized to administer an oath, and shall execute a bond in the penal sum of five hundred dollars, for the faithful performance of the duties of his office. Said bond shall be approved by a Justice of the Peace of the county in which said district is situated. Said bond and oath shall be recorded in the office of the District Recorder, and filed in the office of the County Recorder, by said District Recorder, within thirty days after entering upon the discharge of the duties of his office.

SEC. 14. It shall be the duty of the District Recorder to furnish, at his own cost, suitable books, including indexes; to make all entries and records in a plain and legible manner; to keep the records in good order, and to copy verbatim, and within reasonable time, all instruments, in writing, pertaining to mining claims, filed in his office for record. Also, when called upon to do so, he shall go upon the ground, and survey any mining claim taken up, causing to be firmly established at each corner, at the cost of the claimant, conspicuous monuments, not less than three feet high, on which shall be legible [legibly] and durably inscribed the name of the claim and the date of the survey, signed by the District Recorder. He shall, also, at the cost of the claimant, cause to be firmly established, at the point on the claim where the principal part of the assessment work, or other work, has been done, or at some conspicuous point on the claim, a permanent and conspicuous monument, not less than three feet high, to which shall be securely fastened the name of the company and that of the claim; the number of feet therein, and the date of the survey, signed by the District Recorder; all of which shall be legibly and durably inscribed on wood or some other permanent substance; and he shall prepare and file for record in his office a notice of survey, which shall be substantially in the following form:

——— MINING DISTRICT, }
——— County, Nevada, ———, 18—. }

Notice is hereby given that the undersigned, constituting the ——— company, claim ——— feet in a mining claim, named ———, situated as follows: (Here describe the location by reference to the monuments and other objects in the vicinity, and otherwise, so that, by means of the description, it may be readily found.)

Surveyed (here give the date of the survey.)

(Here give the names of the locators, with the number of feet claimed by each.)

SEC. 15. Upon the request of any one, he shall give a certified copy of any instrument, or matter of record, on file or recorded in his office, if his fees and those of the County Recorder be paid or tendered for the same.

SEC. 16. On the third Saturday of August, November, February and May, of each year, the District Recorder shall file in the office of the County Recorder of the county in which his district, or the principal part thereof, is situated, all instruments recorded in the office of said District Recorder, and not previously filed in the office of the County Recorder; and the County Recorder shall, as soon as may be, duly record and index the same in books to be kept for that purpose, and shall then return said instruments to said District Recorder. In case any such instruments be lost, or destroyed, before they are recorded in the office of the County Recorder, copies of the same, duly certified by the District Recorder, shall be filed in their stead. For recording and indexing the County Recorder may charge and collect from said District Recorder the same fees that are allowed County Recorders by law, which amount shall be collected by the District Recorder from the party proposing to file any such instrument, before said District Recorder shall file the same. Nothing in this Act shall be so construed as to require the District Recorder to file in the County Recorder's office any district laws, or any instruments or records, obtained from any District Recorder elected under district mining laws, unless the fees, as prescribed in this Act for copying, certifying and filing in the County Recorder's office, shall have been paid, or tendered therefor.

SEC. 17. For the safe keeping and due payment of all moneys entrusted to him, the District Recorder shall be liable on his official bond. And if he shall use said moneys for his personal benefit, or shall, in any other manner, misappropriate the same, or shall otherwise willfully neglect or refuse to comply with the provisions of this Act, he shall be liable in damages to the party injured thereby, and, in the discretion of the Court, he shall forfeit his office and be forthwith removed therefrom; and shall be deemed guilty of a misdemeanor, and, on conviction thereof, shall be punished by a fine not exceeding five thousand dollars, or by imprisonment in the county jail for a period not exceeding one year, or by both such fine and imprisonment.

SEC. 18. The District Recorder shall, during all reasonable hours, keep his records open for inspection, and shall, within a reasonable time, record all papers left with him for record, and do all other things required of him by this Act.

SEC. 19. The District Recorder shall not be required to perform any service, for any person requesting his services, until his fees are paid, or tendered to him, if he demands them.

SEC. 20. The District Recorder shall note, on all papers filed in his office, the year, month, day, hour and minute when they were so filed; and all such papers, filed for record, shall be considered as recorded from that time. All papers filed in the office of the District Recorder shall be kept properly arranged, so that they can be readily found.

SEC. 21. All mining claims located and held, under and by virtue of district laws of the several mining districts in this State, previous to the second Saturday of July, 1866, may continue to be held in accordance with the provisions of said district laws, up to the first Saturday of August, 1866. But before said first Saturday of August, the boundaries of such claims shall be clearly defined, by firmly establishing at each corner of the claim a conspicuous monument, which shall not be less than three feet high, and which shall have legibly and durably inscribed on it the name of the claim, and the date of the survey or measurment of the claim. And at the point where the principal work has been done, or at some conspicuous point on the claim, a permanent and conspicuous monument, not less than three feet high, shall be firmly established, to which shall be securely fastened the name of the claim, the number of feet therein, and the date of the survey; all of which shall be legibly and durably inscribed on wood or some other permanent substance; and the owners of said claim shall, before said first Saturday of August, file for record, with the District Recorder of the district in which said claim is located, a description of the location of said claim, by means of which said claim may be readily found. In any case where the location is such as not to involve an area, but simply a ledge location, the monuments, as specified in section fourteen, for the corners of a claim, shall be established at the ends of a claim, on the line of the ledge, as located. No claim on which work has been done, to the amount of one thousand dollars or more, shall be subject to re-location on account of non-compliance with the provisions of this section, until sixty days after written notice of intention to re-locate the same has been served upon the agent or principal manager of said claim, setting forth that if, within sixty days from the time said agent or manager receives said notice, the provisions of this section be not complied with, said claim will be re-located by the party serving said notice. Such notice may be served personally, or it may be given by publishing the same for two consecutive weeks in any newspaper published in the county in which said claim is located; and if no newspaper be published therein, it may then be published in any newspaper published at the capital of the State. In case such notice be thus published in a newspaper, the relocation may be made at any time after the expiration of sixty days from the first publication of such notice; *provided*, that any mining claim on which the assessment dues, required by this Act, have not been paid, as provided in this Act, before the first Saturday of August, 1866, shall be subject to relocation. For the purposes of this Act a claim shall be considered as located in the county in which the principal part of the district in which it is located is situated.

SEC. 22. On and after the second Saturday of July, 1866, all locations of mining claims shall be made in the following manner: On a monument, not less than three feet high, firmly established in a conspicuous place on the claim, there shall be placed a plainly written notice, embracing a description of the ground claimed, the date of location, the name of the claim, the name of the company, and the names of the locators, with the number of feet claimed by each; and a copy of said notice, accompanied by a written request for a survey of said claim by the District Recorder, shall, within thirty days after the making of such location, be filed in the office of the District Recorder of the district in which said claim is located; and in case there be no legally authorized District Recorder in and for the district, or the claim be outside of the limits of an organized mining district, then, and in that case, said notice may be filed in the office of the County Recorder of the county in which said claim is located, and a written request for a survey by the County Surveyor shall be served upon the County Surveyor. Within a reasonable time thereafter, the County Surveyor, or his deputy, shall perform all the duties required of a District Recorder, by the provisions of this Act. He shall keep a record of all his transactions in such cases; and for such services he may charge and receive the same fees allowed by law for his services in like cases. Within thirty days after the making of such location, there shall be done on said claim, as assessment work, to hold the same up to, and including, the day preceding the first Saturday of the then following August, excavation involving the removal of fifty cubic feet of earth or loose material, or five cubic feet of solid rock, for each two hundred feet in the claim; and, as soon as may be thereafter, said District Recorder shall survey the same, and record the notice of survey, as provided in section fourteen of this Act. And said District Recorder shall file and record a certificate in regard to the assessment work, which shall be substantially in the following form:

—— DISTRICT, —— COUNTY, NEVADA. }
———, 18— . }

This is to certify that on the (name of claim) mining claim, governed by the —— Company, surveyed (date of survey), there has been done by, or on behalf of, said company, sufficient work to hold said claim up to the first Saturday of August next.

———,
District Recorder.

SEC. 23. Any person may locate mining claims in favor of others; but no person shall be entitled to hold, by location, more than two hundred feet of any one ledge except by virtue of discovery of the same, for which he shall be entitled to hold two hundred feet additional. In the case of locations made as extensions, the location of two hundred feet, by virtue of discovery, is allowed. No claim shall, in the aggregate, exceed in extent two thousand feet on any one ledge.

SEC. 24. Any location made on a ledge, by authority of this act, shall be deemed to include all the dips, spurs, angles and variations of said ledge. The locators of any ledge shall be entitled to hold one hundred feet on each side of the same, not interfering with the mining rights previously acquired by others; and all dips, spurs, angles, variations, veins, cross-ledges, strings and feeders, within such area of two hundred feet, by the extent of the claim, on the supposed line of the ledge, as located, shall be considered as claimed and held by said locators, and a part of said ledge; and no ledge, in any claim subsequently located shall be followed and worked within said area without the permission of the holders of said area. All measurements of boundaries shall be horizontal air lines. Nothing in this Act shall be so construed as, in any manner, to change the amount of ground that may be held in any mining claim located and held in accordance with district mining laws; but on and after the first Saturday of August, 1866, all such claims shall, in all other respects, be subject to the provisions of this Act. Locations may be made on blind ledges in the same manner as on cropping ledges, and any person, company or corporation finding a blind ledge, in any excavation made by him or them, shall, for ten days after finding the same, have the exclusive privilege of locating the same.

SEC. 25. No person shall become a locator in more than one claim on the same ledge, and any second location, made on the same ledge, by or in the name of a party already located on such ledge, shall be void.

SEC. 26. The holders of any claim shall have the right to use so much of the land in the vicinity thereof as may be requisite for dumps, and for the erection of the necessary buildings, machinery and other works connected with said claim and for the convenient development and working of the same. And in the development and working of said claim, they may sink shafts and inclines, and run drifts, tunnels and cuts on any lands in said vicinity; but the prior owners of such lands shall be entitled to reasonable compensation for all damages sustained by reason of such dumps, the erection of such works, or the conducting of such operations. If the prior owners of any such lands have duly claimed the same as mining ground, they shall be entitled to all the ores taken out in the course of such operations, and they shall not be interfered with in the conducting of their own mining operations on their own claims. The amount of such compensation shall be determined by a majority of three commissioners—one of whom shall be appointed by such prior owners, one by the party engaged in such development or working, and one by the two thus selected. The amount so fixed shall, within fifteen days after the fixing of the same, be paid to said prior owners, or deposited in the county treasury, subject to the order of said prior owners. Said commissioners shall, before entering upon their duties, take and subscribe to an oath, before some person duly authorized to administer the same, to make a true appraisement thereof, according to the best of their knowledge and belief.

SEC 27. No person shall have the right to impede or inconvenience travel by obstructing or rendering unsafe any public street or road; nor shall any one change the direction of any public road without the sanction of the proper authorities.

SEC. 28. For the purposes of this Act, any stakes set, any works erected, or any tree or other object selected and conspicuously marked to designate the boundaries of a mining claim, shall be deemed a monument established for such purpose, if it be conspicuous, and three feet in hight.

SEC. 29. Any person who, willfully, maliciously or wantonly, or with intent to fraudulently change, injure or destroy a boundary, shall remove, injure or destroy any monument, or any mark thereon, established to designate the boundary of any mining claim, shall be deemed guilty of a misdemeanor, and on conviction, shall be punished by a fine not exceeding one thousand dollars, or by imprisonment in the county jail not exceeding six months, or by both such fine and imprisonment.

SEC. 30. For the purposes of this Act, the term "foot," when used without qualification in relation to mining ground, is hereby declared to mean twelve lineal inches, horizontal air line measurement, on the line of the ledge, as located; the term "assessment work" is hereby declared to mean the work done, partly in order to hold a claim, and involving the excavation of fifty cubic feet of earth or loose matter, or five cubic feet of solid rock, for each two hundred feet in the claim; the terms "assessment dues" is hereby declared to mean two cents for each foot in a claim, to be paid for the purpose of holding the same one assessment year; and the term "assessment year" is hereby declared to mean the period extending from, and including, the first Saturday of August of one year, to, and including, the day immediately preceding the first Saturday of August of the following year. The doing of assessment work, or the payment of assessment dues, shall be regarded as evidence of intention to hold the claim on which, or with reference to which, the same was done or paid, for the period for which the same was done or paid. The payment of assessment dues shall be in lieu of the "assessment work" heretofore usually required as an evidence of intention to hold a mining claim for a specified period; and such payment shall not be required in any case where the holders of a mining claim are in good faith, and to the extent specified in section thirty-two of this Act, engaged in developing or working the same.

SEC. 31. On the first Saturday of August, 1866, (at which time the first assessment year shall begin,) this Act shall supercede all district mining laws, and thereafter said laws shall be considered as repealed; *provided*, any and all rights heretofore acquired under and by virtue of such district mining laws, shall be determined in accordance with said mining laws, existing at the time when said rights were acquired. During the period extending from, and including, the first day of May, 1866, to, and including, the day immediately preceding the first Saturday of the following August, no claim shall become subject to re-location by reason of the non-performance of assessment work. Locations may be made under this Act at any time on and after the second Saturday of July, 1866, (at which time the District Recorders elected under this Act shall, if qualified, enter upon the discharge of their duties), and on and after said second Saturday of July, no locations shall be made under district mining laws.

SEC. 32. The doing of assessment work, or the payment of assessment dues, shall not be required in order to hold a claim during any assessment year, if, during the year next preceding such assessment year, there has been done on said claim, by or on behalf of the claimants thereof, an amount of work costing, at a fair valuation, not less than fifty cents for each foot in said claim; but in all other cases assessment work shall be done, or assessment dues shall be paid as provided in this Act. Assessment dues shall be paid for every assessment year by the parties holding the claim, to the District Recorder, elected under this Act, before the first Saturday of August, commencing the assessment year for which they are paid, except as otherwise provided in this section.

SEC. 33. Except as otherwise provided in section thirty-two, every mining claim located and held under district mining laws, on which, before the first day of May, 1866, there has been work done involving the excavation of fifty cubic feet of earth, or loose matter, or five cubic feet of solid rock, for each two hundred feet in such claim, shall be subject to assessment dues. On every mining claim located and held under district mining laws, on which such work has not been done before the first day of May, 1866, assessment work shall be done on or before the day immediately preceding the first Saturday of August, 1866. The doing of such assessment work, or the payment of such assessment dues, shall enable the owners of said claim to hold the same for the next ensuing assessment year, commencing on the first Saturday of August, 1866.

SEC. 34. The assessment work done within the thirty days after the location of a claim, under this Act, as provided in section twenty-two, shall hold the same only up to the beginning of the assessment year following the date of said location, and for such next ensuing assessment year, and for such next ensuing assessment year, and for every year thereafter (except as provided in section thirty-two of this Act), such claim shall be subject to assessment dues.

SEC. 35. For any assessment dues paid to the District Recorder, he shall give a receipt, which shall be filed for record, in the office of the District Recorder, before the expiration of the time for the payment of such dues. Said receipt shall be substantially in the following form:

$——— Received——— District, ———— county, Nevada, ———, 18—, from ———— (amount) in full, as assessment dues on ———— mining claim, for the assessment year commencing on the first Saturday of August, 18—.

———,
District Recorder.

SEC. 36. The doing of any assessment work, or the payment of any assessment dues, by any one or more of the owners in any mining claim, shall not be held to extend to or protect any interest or interests in said claim, beyond those specifically covered by the doing of such work or the payment of such dues; and any portion or portions, interest or interests, in any claim or claims, on which the requisite work has not been specifically done, or the requisite dues have not been paid, shall be forfeited and subject to re-location, the same as if no work had been done, or no dues been paid, on any portion of said claim; but a receipt given to the company shall be sufficient to cover all ground claimed by said company, without specifying the separate owners therein.

SEC. 37. All papers relating to any claim in any mining district in which there is no District Recorder, or which is not within the limits of any mining district, may be filed in the office of the County Recorder of the county in which said claim is located; and in any such case, the surveys may be made by the County Surveyor of said county, or his deputy; and the assessment dues may be paid to the County Treasurer of said county, who shall give a receipt therefor, which shall be substantially in the form prescribed in section thirty-five. Before the expiration of the time for the payment of said assessment dues, said receipt shall be filed for record in the office of the County Recorder of said county.

SEC. 38. If, within thirty days immediately preceding the time that it becomes necessary to do the assessment, or other work, on any mining claim, it is generaly believed that the section of country in the vicinity of said claim, or the route which it is necessary to travel in going to said claim, is infested by hostile Indians, the doing of said work may be postponed for six months from said time; but one of the owners of said claim, or his agent, shall, within said thirty days, before some officer competent to administer an oath, take and subscribe an oath, which shall be substantially in the following form:

"I, A B, do solemnly swear (or affirm) that I am one of the claimants (or the agent thereof, as the

ease may be,) of (here give the name of the claim, and describe its location, so that it may be conveniently found,) and that I have good and sufficient reason to believe, and do believe, that the doing of (here name the assessment work or other work to be done,) would be attended by serious danger, by reason of hostile Indians in the vicinity of said claim, or on the route over which it is necessary to travel in going thereto. (If an oath,) So help me God. (If an affirmation,) Under the pains and penalties of perjury."

Said oath shall, before the time expires for the doing of such work, be filed for record in the office of the District Recorder.

SEC. 39. In case of the failure of a claimant to do, within the time specified, anything on, or with reference to a mining claim, which by this Act is required to be done within a specified time, said thing may be done thereafter; and if such claim has not been re-located after the expiration of said time, and before said thing has been done, it shall have the same force and effect as if done within said time.

SEC. 40. The claimants of any mining claim who fail to comply with any of the provisions of this Act, shall forfeit all right thereto, and shall be deemed to have intentionally abandoned the same, and thereafter such claim shall be subject to re-location.

SEC. 41. All instruments filed in the office of the District Recorder, and all records made in said office, in pursuance of this Act, and all copies of such instruments and records, duly certified by the District Recorder to be full, true and correct copies or transcripts thereof, shall be received as evidence in all courts, and in all actions and proceedings.

SEC. 42. Any person who shall willfully change, deface or obliterate any instrument filed in the office of a District Recorder, or any record made in the books of such office, or insert in such instrument or record any new matter, or who shall steal, or willfully mutilate or destroy any instrument filed in the office of a District Recorder, or any part thereof, shall be guilty of a misdemeanor, and on conviction, shall be punished by fine, not exceeding five thousand dollars, or imprisonment in the county jail for a period not exceeding one year, or by both such fine and imprisonment; and shall be liable, to any person injured thereby, for double the amount in damages.

SEC. 43. The fees of the District Recorder shall be as follows: For filing any paper, twenty-five cents. For each one hundred feet of mining ground measured, twenty cents. For measuring the assessment work on the mining claim of any company, giving a certificate in regard thereto, and recording and indexing the same, two dollars. For each certificate, twenty-five cents. For the recording and indexing of any instrument containing less than two folios, of one hundred words each, one dollar; and for each additional folio, twenty-five cents. For each certified copy of any instrument or record containing less than two folios, one dollar, and for each additional folio, twenty-five cents, including the certificate.

SEC. 44. All moneys paid to the District Recorder, as assessment dues, shall be paid by him to the County Treasurer on the third Saturday of August, November, February, and May, of each year. The County Treasurer shall give a receipt for said moneys, which shall be filed and recorded in the office of the District Recorder. The County Treasurer shall pay said moneys to the State Treasurer at the same time and in the same manner that he is required to pay taxes to the State Treasurer; and said moneys shall be set apart as a mining school fund.

SEC. 45 The extraction of gold, or other metals, from alluvial or diluvial deposits, generally called placer mining, shall be subject to such regulations as the miners in the several mining districts shall adopt.

SEC. 46. In the conveyance of any interest in any mining claim, the description shall be deemed sufficient if it embraces the number of feet conveyed, the name of the claim, and the name of the company by which it is designated, and the district and county in which the claim is situated.

SEC. 47. The provisions of this Act shall be applicable to all the counties of this State, except the county of Storey, in which county none of the provisions of this Act shall be deemed to apply or have force or effect.

ANNUAL REPORT
—OF THE—
Pacific Insurance Company.

IN COMPLIANCE WITH THE ACT OF THE LEGISLature of the State of California, entitled "An Act concerning Corporations," passed April 22, 1859, the Pacific Insurance Company of San Francisco makes the following Annual Report:

I.—The number of the Capital Stock of this Company is SEVEN HUNDRED AND FIFTY THOUSAND DOLLARS, and paid in GOLD.....$750,000

II.—The amount of the Assets is ONE MILLION AND FIFTY-ONE THOUSAND, FOUR HUNDRED AND TWENTY DOLLARS AND THIRTY-SEVEN CENTS..$1,051,420.37

III.—The Company has NO DEBTS

IV.—The amount of insurance effected during the year, and which remained in force December 31, 1865:

Fire	$12,973,949
Marine	451,408

This Company commenced underwriting Marino Risks, August 1, 1865:

V.—This Company insures against the following risks, viz.: BUILDINGS, HOUSEHOLD FURNITURE, MERCHANDISE, RENTS, LEASEHOLDS, VESSELS IN PORT AND THEIR CARGOES, and other PERSONAL PROPERTY, AGAINST LOSS OR DAMAGE BY FIRE.

Also, on CARGOES, TREASURE, COMMISSIONS, PROFITS, and WAR RISKS, and ON ALL MARINE AND INLAND NAVIGATION RISKS, TO AND FROM ALL PORTS IN THE WORLD.

VI.—This Company will take on any FIRST-CLASS RISK not to exceed $75,000 (the limit fixed by law), and on all large risks will reinsure to an extent consistent with PRUDENCE in other RESPONSIBLE COMPANIES.

J. HUNT, President.
A. J. RALSTON, Secretary.

State of California, City and County of San Francisco, ss. On this nineteenth day of January, A. D. one thousand eight hundred and sixty-six, personally appeared before me, H. S. Homans, a Notary Public, in and for the said City and County, and therein residing, duly commissioned and sworn, A. J. Ralston, who, being duly sworn, did depose and say that he is the Secretary of the Pacific Insurance Company, and that the statements contained in the foregoing Report of the Pacific Insurance Company are true, full and correct. A. J. RALSTON.

Sworn and subscribed to before me, this 19th day of January, A. D. 1866. H. S. HOMANS, Notary Public.
4v12-3m

Important to Californians.—Many inventors have ately had their claims for Patents seriously (and in some cases fatally) delayed by the unqualification of agents who have not complied with the Government license and revenue laws, as well as other new and imperative regulations. These discrepancies, although arising from the inexperience of honest agents, are none the less dangerous to applicants for patents, whose safest course is to trust their business with none but active and experienced solicitors. THE MINING AND SCIENTIFIC PRESS PATENT AGENCY has strictly complied with the requisitions of the Department, and properly filed all necessary papers as Claim Agents.

TWELFTH VOLUME.—The MINING AND SCIENTIFIC PRESS, published at San Francisco, commenced its twelfth volume on the 6th inst.—[Nye County News.

CALIFORNIA
BUILDING AND LOAN SOCIETY

Removal Notice.

THE DIRECTORS OF THE CALIFORNIA BUILDING AND LOAN SOCIETY, announce to the public the removal of their business to their

NEW BANKING HOUSE,
California Street, one Door from Sansome.

LOANS.

The Directors propose an extension of their Banking accommodation to the assistance of—

First—The Purchase of Real Estate.
Second—The Erection of Houses.
Third—The Erection of Manufactories.
Fourth—The Building of Sea and River Vessels of all sizes.
Fifth—Mercantile Cash Credits on the Scottish principle, for such time as may be agreed upon.

Under the above general heads, loans will be made for terms of years to correspond with the requirements of parties upon the security of REAL ESTATE, BUILDINGS, SHIPS and MERCHANDISE.

MONTHLY DEPOSITS.

ONE PER CENT. PER MONTH will be allowed on all deposits made at one month's notice of withdrawal.

CURRENT ACCOUNTS.

HALF PER CENT PER MONTH will be allowed on the daily balances to credit of Current Banking Accounts—the same to be ascertained and credited monthly.

REMITTANCES FROM THE COUNTRY
PROMPTLY ACKNOWLEDGED.

INTEREST on all sums commences from the day of deposit.

DEPOSITS of any amount received, from FIVE DOLLARS upwards.

OFFICE HOURS—9 1-2 A. M. to 3 1-2 P. M. daily.
SATURDAY EVENINGS from 6 1-2 to 9 o'clock.

THOMAS MOONEY, President.

CAUTION.

TO WHOM IT MAY CONCERN:—THE PUBLIC ARE hereby notified that a patent was allowed, December 27th, 1864, and issued June 27th, 1865, to PROFESSOR HENRY WURTZ, for the use of sodium and amalgams thereof with quicksilver, in the extraction of precious metals from their ores. All persons using said amalgams, or purchasing or selling sodium or said amalgams for use in the treatment of gold or silver ores, are hereby cautioned that they will be prosecuted to the full extent of the law.

The patents of Professor Wurtz have been assigned to the WURTZ Amalgamation Company of New York city. It is the intention of the said company soon to appoint agents for California and the other mining States and Territories. In the meantime, applications for licenses to use sodium and its amalgams, may be addressed to the company, at their office, No. 57 Broadway, New York.

C. ELTON BUCK, Secretary.

From the Stock Circular of Associated Brokers of the S. F. Stock & Exchange Board.

SAN FRANCISCO, SATURDAY MORNING, May 5, 1866.

Capital continues abundant for all the legitimate requirements of the season, and the Bank rates show no variation—1@1¼ ₱ cent. ₱ month being the prevailing figures. Out-door negotiations rule at 1½@2 ₱ cent. where parties are less favorably known, and consequently more helpless in the hands of the money-lender. Loans upon Mining Stocks have been made with more hesitancy this week, and considerable distrust is evinced by capitalists as to the future of some claims. The effect of this upon the Stock Market (combined with other causes), has been depressing but healthful for the mining interest by checking purely speculative operations and directing attention more closely to the actual condition and merits of the different companies.

Receipts of treasure from domestic sources are fully up to the usual average, and since Saturday last, have exceeded $950,000. The product of Nevada amounted to $1,100,000 last month, and the aggregate recorded receipts of bullion in this city were about $4,000,000, during the same period. Bullion has met with no especial inquiry this week, and rates are substantially unchanged. Gold bars 840@850, silver, ½@1 ₱ cent. premium.

The Mining Share Market has been characterized by considerable activity, but, with scarce an exception, nearly every stock on the list still further declined early in the week. The short interest inaugurated last week with so much vigor has continued to attract attention, and sellers' option contracts are yet made with some freedom. The prospective demand, however, for stock for future delivery growing out of these sales, together with the favorable tenor of advices from certain claims, have imparted rather more strength to the market since Thursday, and it is thought that a rally will now take place.

City Shares are growing in favor, and for the most part are strongly held at enhanced rates. San Francisco Gas was sold at $105, and is now held at $110. California Steam Navigation rose to 59½ ₱ cent., and Spring Valley Water to $67 ₱ share. The latter company pay a dividend on the 10th inst. North Beach and Mission Railroad is held at $61, and Omnibus was dealt in at $60.

Crown Point is dull and inactive; small sales were made at $1,250, closing at about $1,250 bid. During the week ending 28th ult., 746 tons of ore were extracted. No material change has taken place in any portion of this mine. The south incline is down some ten feet in a "fair body of good ore," and the south drift is again underway. Receipts of bullion for the month of April exceeded $100,000, and a dividend of $80 ₱ foot will probably be declared on the 10th inst. The suit of C. L. Low *vs.* this Company, involving a title to fifty-six feet of stock, is now on trial in Virginia City before his Honor Judge Rising.

Savage was sold at $1,000@975, and is now held at $985. In the week closing on Saturday last, 466 tons of ore were taken from the mine, as follows: 22 tons first-class, 302 tons second-class, and 132 tons good quality of third-class. The best portion of the body of ore in the 6th level has now been reached, showing, it is said, a width of 20 feet. In going north on this ore-seam the quality improves, but with less width, and a few feet south of the prospecting drift the indications are also thought to be flattering. The upper works are still producing a little ore, and 25 tons first-class worked recently from the Potosi chimney yielded $390 ₱ ton. The ore from the latter is found 41 feet above the fourth station, and at a small distance east of the old Savage works at that level and close to the Gould & Curry line. The old shaft is down some 25 feet below the 6th level, and good progress is being made in sinking the two southern compartments of the Curtis shaft.

Hale & Norcross receded from $940 cash, and $970, buyer 30, to $910, and then sold at $915. There is no new feature in this mine so far as we are informed. The incline from the seventh level is down 85 feet, and at 15 feet greater depth a drift will be started for a new station—765 feet (vertically) from the surface. A dividend of $50 ₱ foot will be declared on the 10th inst.

Gould & Curry fell from $850 to 725, and then rallied to $850 bid. In the north branch drift, second station, a considerable body of water was met with on the 29th ult., but is now said to be subsiding. The south end of the upper works is said to be looking well and a fair show of ore will, it is thought, extend to the surface. Receipts of bullion last month were $143,000, and the ore crushed, chiefly at the Company's mill, averaged about $46 ₱ ton. There is a prospect of a dividend of $50 ₱ foot some time this month.

Yellow Jacket has been active at fluctuating rates, and some 200 feet were dealt in, receding from $835 to $665, rallying to $725, and selling yesterday at $685@705. During the two weeks ending April 23d, 1,768 tons of ore were extracted, but no returns have been made thus far of the average yield ₱ ton. The winze sunk from third level, north mine, is now down some 45 feet and is said to be in good ore, and in the lower level of the south mine the indications are thought to favor the existence of a large body of ore.

Ophir has been quite a feature of the market this week, and nearly 500 feet were sold, steadily declining from $710 to $500, rallying to $580, dropping to $550, and changing hands yesterday at $521@505. In running north from the ninth gallery the first, second and third floors have shown some deterioration this week, but the ore in the third extends further north than the first floor, and the same theory will doubtless hold good in stoping and drifting upon the upper floors. There is no material change in either the east or the west drifts from that gallery, and little or no difficulty is apprehended with regard to water. In the eighth the south drift is progressing slowly. The sixth gallery is said to look well, and a reliable body of ore will, it is thought, be found at that level. In the fifth the drifts have met with quartz, but no ore as yet. Receipts of bullion last month amounted, in the aggregate, to $99,200.

Chollar Potosi steadily declined from $315 to $295, rose on Thursday to $330, buyer 20, and sold yesterday at $317@313. Recent advices would seem to indicate no important change in any of the stations. During the week ending 27th ult., 773 tons of ore were sent to custom mills, and 133 tons were sold at $5 ₱ ton. The drift from the first station—new shaft—is in some 300 feet and it is thought that the lode will soon be reached.

Belcher is in rather better favor, advancing from $305 to $355, and then selling at $340@315. Empire Mill has also improved, advancing from $175 to $190, and closing at about $185.

Imperial fell from $135 to $127, rose to $142, and sold yesterday at $139@140. The total yield of bullion for the month of April, was $90,200, and a very considerable surplus is now at the credit of the company. The Rock Point Mill made full time last month, and the Gold Hill Mill ran from the 1st to the 25th ult. The drift east from the bottom of old shaft is in about 135 feet, and the new shaft has attained a depth of 350 feet.

Overman was dealt in to the extent of 1,020 shares, within a range of 86½@72, closing at $75. Bullion rose from $78 to $90, fell to $80, and closing at $80. Confidence declined from $27 to $15, and sold yesterday at $15. Sierra Nevada fell from $6¼ to $3½, and closes at $4¾.

The total recorded sales of Stocks since Saturday last inclusive, amounted to $786,011.

Mining Summary.

CALIFORNIA.

Alpine County—

The following notice of the "Mountain" ledge, is condensed from the *Silver Mountain Bulletin:* "The present tunnel was commenced in December, 1864, and it has been driven steadily ahead without cessation, excepting holidays, ever since. The estimated distance to run before cutting the main ledge was 1,150, and they are now in 700, leaving 400 feet yet to be run, which they feel certain of accomplishing by the 1st day of December, 1867. The last 150 feet has been through rock of the hardest character known in this section, but is now becoming softer, and a large volume of water that burst forth about ten days since, gives indications of the near approach to a ledge, although not the main one. Fourteen feet back from the present face of the tunnel, a small strata of quartz was struck that is very rich in ruby silver. * * * * The Mountain ledge is set down as the monster ledge of Silver Mountain District, as at the point cut in the upper tunnel, it was 60 feet in thickness."

The temporary difficulties under which the Wide West has been laboring are about being adjusted,—and they will soon resume operations.

From the *Gazette* we glean the following items:

Rock for the Mill.—The Buckeye No. 2 Company, near Silver Mountain, have entered into a contract with the Pioneer Mill at Markleeville, to supply that Mill with ore on condition that they make it yield one hundred and fifty dollars per ton, and the proprietors of the mill have agreed to take two tons on these terms, with the privilege of more if it works as they are confident it will. Dr. Winters, the assayer of the mill, thinks there will be no difficulty in getting the $150 out of it.

The ledge of the Lady Franklin is opened a short distance from where Buckeye No. 2 have made their rich strike.

The Mowyer is to be thoroughly prospected. Most of the stock is owned by parties in Illinois.

The tunnel of the 'American T. & S. M. Co., is now in 295 feet. Several spurs were passed through in running this tunnel, some of which show 'very pretty ore.'

Amador County—

The *Ledger* says that as soon as it hears of a claim in that county is *not* good, it will make a note of it as a news item.

The Coney quartz lead was sold a few days ago to a San Francisco company for $75,000. "The claim is considered cheap by those who understand quartz mines, but there are plenty more in this county equally as good, if we only had the capital to work them."

Messrs. Coney and Hayward have purchased the entire interest of Dr. Rendell in the Rendell copper mine, one mile north of the Newton and on the same range, and intend pushing forward work on it vigorously.

The Oneida mill has again commenced operations.

Butte County—

The Rancheria diggings, three miles below Oroville, are still being successfully worked. Water is sold at "one hit" per inch. The *Record* says that there is not an acre of ground for miles around Oroville, that does not contain gold; that one cannot miss "the color," let him sink a shaft where he will. When the Fraser River and Washoe excitements commenced, these placers, though still well worth working, were abandoned; and seem never to have felt the return tide of disappointed prospectors after "big things."

Calaveras County—

Some parties who have been prospecting a quartz lead in Happy Valley, have struck very rich rock. Work will soon be commenced on the claim in earnest. The *Chronicle* says: "From all parts of the county we continue to hear the most favorable accounts of our quartz mining interests. In the San Andreas district several lodes of great richness have been discovered within the last few weeks, which has created quite an excitement, and given a new impetus to prospecting. In our immediate vicinity a large number of companies are at work prospecting, many of them with the most flattering expectations of success. Calaveras will soon rank as the richest quartz mining county in the State."

Mariposa County—

The *Gazette* has a letter from Horse-Shoe Bend, in which the writer says there are still acres of mining ground unoccupied that would pay from two to four dollars per day, if worked by practical miners.

Messrs. Leland & Innes, who are drifting about 500 feet in the flat, are averaging about six dollars per day. Mr. C. Howland, who has been working his claim for about four years, is still doing well, after taking out thousands of dollars. Adjoining Mr. Howland is the claim of Messrs. Pettit & Bertran, which has paid well.

Twenty or thirty tons of rock from Lewis' quartz ledge, averaged $23 to the ton.

Ninety tons from the Hope, averaged $16 per ton.

A new discovery of a rich quartz vein was recently made on the head of Coarse Gold Gulch, about six miles southeast of McKeown's store, in Fresno county, by Colonel John Moss and Wm. Shear, of San Francisco. The owners have gone below for machinery, and intend erecting a mill immediately.—*Free Press.*

Recent accounts from the upper veins of the Hunter's Valley district are encouraging. La Victoire mine is now under the skillful management of Mr. P. D'Artigues, a very rich body of ore has been recently discovered, and the company will shortly recommence shipping.—*Free Press.*

The Potts' vein is said to be yielding from sixty to eighty dollars per ton.

The Buena Vista Petroleum company have determined to put up a distillery upon their claim.

Nevada County—

The *Gazette* says: After a trial of a week of the merits of the Waltzing pan, by W.C. Stiles, at his mill, we learn that he has determined to put in six or seven others of the same kind, and use them in place of the Knox pan.

A fine specimen of quartz and gold was recently taken from the claims of Mr. Souchet, at North Bloomfield. It is about two by five inches square, and is estimated to contain four hundred dollars.

Horace Ferre, who sometime since sold a portion of the California ledge, to New York capitalists, with the view of securing means to erect machinery to work the mine, has received instructions to commence operations. The ledge will be opened by an incline shaft, and an engine and machinery for hoisting and pumping will be put up without delay.

At the last run made by Binsley & Co., at Kentucky Flat, near Newtown, they cleaned up one hundred ounces of gold, all in coarse pieces, varying from twenty-five cents to ninety-six dollars.

The *National* says that Taylor, of the Grass Valley iron foundry, employs twenty-four persons, and is crowded with work. He has just completed an immense hoisting engine, the largest ever made in the county, for the celebrated Allison Ranch company. Taylor is also making a 16-stamp mill, of four batteries, for the North Star company, at the French lead. Each stamp will weigh about nine hundred pounds. The engine is to be 60-horse power and will be capable of doing all the work required.

We clip the following in regard to cement mills, from the *Gazette:* We learn that the cement mill of G. W. Clay & Co., at Hunt's Hill, will be started in operation again to-day or to-morrow. The owners were compelled to suspend operations in consequence of damages to the ditch, supplying water for the motive power. The mill of Tucker & Carney, near Clay & Co.'s, has been kept in operation regularly, and the owners are now making from $1,000 to $1,500 a week, clear of expenses The cement mill of the Gouge Eye company, at the little town of that name, is completed, and will be started up to-morrow. This is an 8-stamp mill, run by a hurdy gurdy wheel, and the owners have a fine bank of cement which will amply supply the mill. The Eastern mill, near the Gouge Eye, and of the same capacity, will be completed in two weeks.

Hunter's Concentrator is being introduced and approved of in Grass Valley. The Empire company intend to put twelve of these machines in their mill.

Six Knox Amalgamators have been purchased for the new mill at Ophir Hill.

A 20-stamp mill is to be put up by the Union Hill company.

Three bars, weighing together thirteen hundred ounces, valued at $17.40 per ounce, were the result of twelve days' run at the mill of the Eureka company, last week.

The Cambridge company is putting up hoisting works. As soon as they are completed, they will commence the erection of a mill.

The boiler for the hoisting works of the Burrington company, has arrived, and the company expect to have the machinery in operation in the course of two or three weeks.

Messrs. Norton, Hardy & Co., of the Ophir Hill mining company, have just erected a 20-horse power steam engine and attached to it a six-inch pump for freeing the mine of water. The shaft, five by ten, has been sunk to the depth of ninety-five feet.

The Empire company, south of the former, have worked their mine within a few feet of Norton & Co.'s line, disclosing there one of the richest and most valuable mines in the district.

At the depth of eighteen feet, the new Greenhorn copper ledge, says the *Gazette*, "holds its full size, being from three to four feet in width, and there appears to be no diminution in the richness of the ore. A shaft has been started on the northerly extension, some two or three thousand feet from Thorp's location, where the ledge has been struck, and the ore appears to be equally as rich at the same depth in the original location.

Placer County—

The following items are from the Placer *Herald:* The Pacific company, near Ophir, are still working away at their shaft. They are down now forty-eight feet, and the ledge at that depth is five feet and two inches thick.

A location was made within a mile of the Pacific this week, the croppings of which was assayed by Waters & Co., of Sacramento. The result was $410.85 to the ton.

Mr. Millet is about erecting a quartz mill on Baltimore Ravine, on the Haney quartz claim, which has been worked for some time by an arastra, and has yielded remarkably well.

The Lone Star company, near Ophir, have recently struck rich rock. The company are down about ten feet, at which depth the vein shows a width of about twenty inches, and contains considerable free gold. The company intend going down with their shaft.

Quartz prospecting is engaging the attention of miners all through the lower section of this county. New locations are constantly being made.

The Auburn *Stars and Stripes* says: We have definite information that work will shortly be commenced on several ledges near Auburn. Among others, the American and Jackson, Conrad and Herald, Holdredge, Baker, Green Emigrant and the Montgomery, which is believed to contain considerable silver, will be thoroughly prospected. The Emerald Isle, located in Yuba county, has been secured by home capital, and several other claims in its neighborhood by Eastern capital—among them the Altona, Last Chance and Mammoth. Upon the Altona machinery will be erected immediately and work prosecuted with all the energy which liberal capital can command. We confidently expect that a few months hence, Placer will rank as one of the first mining counties in the State. We candidly believe that, all things considered, there is no better field in the world for quartz prospectors and miners than may be found within the limits of our county.

Plumas County—

The Monitor company at Saw Pit realized, in two days' washing, 155 ounces; one piece weighed forty-six ounces.

The Eagle, in two days, cleaned up 106½ ounces.

The New York company, in six days, took out 510 ounces.

The diggings recently struck at Willow Ranch, and reported as new, were worked in 1852, and paid richly. A four-ounce specimen picked up about a week ago, contained $50 worth of gold. The gravel is easily piped down.

Bonner & Hardy's claims, on Chip Flat, are said to be paying well.

The Crescent company, at Indian Valley, has struck a chimney of very rich rock in the west end of their main tunnel. Gold can be seen in almost every piece of quartz taken out.—*Quincy Union.*

Sierra County—

The Downieville *Messenger*, of April 28th, says:

Hawkins & Co. cleaned up, for two men shoveling two days into boxes, twenty-one ounces, a few days ago, says a correspondent.

Jim Messerve finds his new quarts claim growing richer the deeper he goes. Beautiful specimens were on exhibition in town.

A piece of gold, weighing ten ounces, was picked up last week in the Live Yankee claims, near Forest City.

A letter from Goodyear's Bar to the *Messenger*, says: "As figuring most conspicuously, I will mention Newell's, Connelly's, Moore's and Jenning's, and lastly, but not least, the Downieville, *alias* Empire Co.'s claims, which are all paying handsome dividends to the lucky owners. Besides these, there are quite a number of other claims, which, after proper development, may turn out to be just as remunerative."

The Alleghany correspondent of the *Messenger* says: "Times are very lively here. * * * * * * *

The Union company struck a pocket containing three or four thousand dollars, a few days ago. That with the usual rock crushed will make a good clean up. The Masonic claim pays as usual, the best of anything in this vicinity. They work about thirty men. The Oak Flat company have their quartz mine thoroughly prospected, and it is thought they intend to sell it for something like a hundred thousand dollars, instead of putting on a mill themselves, as their old mill is now useless. The Twenty One company are anxiously waiting for the roads to open so they can get the machinery to complete their mill. The Fac Simile company are about to commence work, the water having prevented them from doing so for some time past."

Siskiyou County—

The Yreka *Journal* says that Scott Valley is getting to be a second Grass Valley for quartz. Sanborn & Co. have struck and are prospecting a lead on Smith's creek, near Rough and Ready, which presents every appearance of being silver. The rock is precisely the same in appearance as that of the Comstock lode in Nevada. The lead is a wide one, and the company are sanguine it is the genuine ore.

Great excitement existed at Scott Bar in regard to rich discoveries on Quartz Hill. One thousand dollars was said to have been taken out in the first day's work. "The second day's work is reported at $6,000, with over $50,000 in sight."

The Golden Gate shaft is now down fifty feet. The prospects are good.

Tuolumne County—

Near Cold Spring Cottage 'some men are working a bank of dirt that has been prospected by hundreds of miners, and left in disgust; yet good wages are being made out of it. In several places in that vicinity, which have apparently been turned over a dozen times, men are getting good returns.'

The Junction Flume Company have re-commenced work near where Woods' creek and Sonora creek unite. They have completed some several hundred feet of flume, and are pitching in right earnestly. The ground they propose working will pay from seven to ten dollars a day to the hand. The company has worked this claim for the past seven or eight years, during the summer season, with good results.

The *Courier* of April 28th, says: "Last Wednesday, at Jamestown, Judge Preston showed us a specimen which eclipses any quartz exhibition we ever saw or heard of, for beauty. The piece weighs several pounds—say four, and is fantastically ornamented with gold in all sorts of shapes, some parts being in the correct form of leaves, with all the fibres plain and distinct, as if executed by a skillful jeweller; others assuming the proportions of bunches of grapes and clusters of berries, most beautifully arranged. The real value of the specimen cannot be estimated, though intrinsically it is set at $328, which is its valuation by displacement. It is the most beautiful specimen in the State, without doubt, and would be the crown-piece in any cabinet. It came from the Hesscock claim, below Jamestown."

Tehama County—

The Mammoth has commenced work again.

Rock from the Red lode, worked at the Union mill, Lower Springs as a test yielded $15 per ton.

The Jollie Brothers have opened a lode at Muletown. It is two feet wide, and is tapped from a gulch, two hundred feet below where it crops on the hill. Four hundred and twenty pounds of the rock worked at Kelly's mill, yielded twenty dollars.

The lower tunnel in the Kellenger mine is a little over 900 feet.

Tulare County—

The Visalia *Delta* of April 25th, says: Mr. John Roberts, one of the owners of the Long Tom lode, has been in town for a number of days. We see some of the up country and Nevada miners talking about their ten and twenty stamps producing three and four thousand dollars per month, while every days' work of the Long Tom company's mill yields $1,000, and this with only twenty hands in mill and mine.

Yuba County—

The Pittsburg mine was sold recently to an Eastern company for $115,000. This mine adjoins the famous Blue Gravel claim.

The Shamrock and Creary's claim, though not yet fully developed, is said to give evidence of great richness.

Timbuctoo is going to decay. Its mines are worked out. "On the main street of the town whole rows of houses are closed, not having been occupied for a year or more. All energy and life seems to have departed from it, leaving it forsaken and desolate."

NEVADA.

Washoe—

The body of water lately struck in the Overman mine has been so far reduced that the workmen are now able to proceed with their operations on the lower level. They are now down 700 feet.

We yesterday heard of some exceedingly good work having been done at Rigby's mill, by the wet process, upon some of the stubbornest sulphuret ore from the Ophir. The ore experimented upon weighed 127 pounds and was worth according to assay $60.38. The value of the bar returned was $58.13. The very rich ores of the Comstock have heretofore

either been shipped to England or worked by the Freiberg process; it would now appear that it can be successfully worked by the wet process.—*Ter. Enterprise.*

The Swansea Smelting Works, at the south end of Washoe Valley, are now in good shape for work, and started up a few days ago. The proprietors are old furnace men from Swansea.

Dayton—

The *Territorial Enterprise* says of the Yellow Jacket mine, to which its editor paid a visit the other day—"This mine is a pattern of neatness, order and good workmanship, being splendidly timbered and the drifts high and roomy. There is but little water to contend with, an hour's working of the pump each day keeping the mine free. The pump is twelve inches in diameter, which lifts the water 255 feet, at which point it is discharged through the Gold Hill tunnel.

The Lyon County *Sentinel* of April 28th, says: "The Rock Point mill has lately received a new retort, of 1,500 pounds capacity—said to be the largest in the State."

Reese River—

We gather the following items from the Reese River *Reveille:* "A body of rich ruby sulphuret ore, about seven inches thick, in a formation of five feet, has just been developed in the Yankee Blade. The sample shown us to-day, in the assay office of Boalt & Stetefeldt, was of beautiful ruby silver, equal to the finest in the district."

James McCann has just discovered and located a handsome ledge in the Yankee Blade ravine. It is situated about 500 feet above and north of the Confidence, and is eight feet thick at the surface. Mr. McCann has named this fine vein the Patriot. A sample of its ore has been assayed by Messrs. Boalt & Stetefeldt, which yielded $1,630 40 of silver per ton.

We saw this morning at the assay office of Boalt & Stetefeldt, handsome specimens of beautifully crystallized native sulphur. They were obtained from a vast bed of gypsum, impregnated with sulphur, situated near the volcano a few miles north of Silver Peak.

Four bars from the Midas mill, the product of sixteen tons of ore from the Fortuna mine of the Consolidated Silver Mining Co., and valued in the aggregate at $2 987.41, were stamped "First born of the Consolidated S. M. Co."

Ore from the Great Republic, in White Pine district, yielded by assay $295.20 of silver per ton.

The mill charges for working ore at Reese River, have hitherto been from $55 to $65 per ton. Capt. A. L. Page, general superintendent of the mill and mine, has taken a step in the right direction. He proposes to reduce ores in lots of twenty tons and upwards, at $45 per ton, and smaller lots at the rate of $50 per ton; and he guarantees to pay eighty per cent. of the assay of the "pulp" of each particular batch of ore. The *Reveille* says: "This will be cheering news to our miners, and will cause many an idle mine to bring forth fair fruit of silver."

J. E. Clayton goes to New York to represent a mining property at Silver Peak. He has with him an elaborate report on the property, including a minute description of the district.

The Home Stake mill has again commenced running.

Several gold mines are being opened on Middle Hill.

The new 10-stamp Empire mill, Yankee Blade Ravine, is now in full operation.

The *Reveille* has been presented with four fine specimens of salt procured from Silver Peak, Smoky Valley, New Pass, and Humboldt. The specimen from Silver Peak is very beautiful, and is in the form of a cone three inches high; it is snowy white, and its myriad tiny crystals emit rays of light of almost diamond brilliancy.

A letter to the Nye County *News*, from North Twin River district, dated April 17th, says the machinery for the mill of the famous Murphy mine, is on the ground. It is to be a "forty stamper."

Two large mills are to be built in Silver Peak district.

A New York company have purchased a number of the mines in Clan-Alpine district, twenty miles from Austin, and have erected a fine 10-stamp mill, which is now ready to commence work. They are now taking out ore from one of their ledges, from which they have had very flattering returns by repeated assays. A town site has been surveyed, and a map made, and everything is in complete working order.

Esmeralda—

The two new districts, viz: Baldy and Myers, alluded to in our last issue, are to be thoroughly examined. Drs. Mitchell and Fitzhugh started on the 13th April for the purpose. The ledges in both districts are said to be large and well defined, and the ore taken from them is pronounced by good judges to be of excellent quality.

The *Union* says the Del Monte mill will probably commence running again about the first of May.

Owen's River—

Reports from this district are favorable. The Kearsarge ledge has been actively worked during the winter. Work will soon commence on the Lexington, Yosemite, Washoe and others. The frame of the Kearsarge mill is up, and the machinery being placed in position. Mr. Dorr, agent for the New York Mining and Milling Company has just arrived with a powerful mill from San Francisco, via Los Angeles. Other mills are said to be projected.

IDAHO.

The Owyhee *Avalanche* speaks of the rush to Montana as having raised the rate of wages to $6 per day; while it must inevitably lower the rate to Montana, and so send back disappointed laborers in full force later in the season, and in the end Idaho will be the gainer by the stampede.

A mammoth ledge, called the Dardanelles, forty-three feet in width, at the head of Jacob's Gulch, two miles north of west of Silver City, and the same distance west of Ruby, was discovered six months since, but kept a secret until within a few days past. The ore averages, by assay, $150 per ton. The company owning it claim a large tract of timber in the neighborhood, and an eligible mill-site. The lode has been traced over 3,000 feet.

In the Owyhee district there are now in full operation the following mills: Morning Star, 8 stamps; Minear, 5 do.; Jackson, 5 do.; Vass, 4 do.; Ainsworth, 10 do.; Shoenbar, 10 do.; New York and Owyhee, 20 do.; Cosmos, 10 do.; Lincoln, 20 do.; Grenzebach's, 10 do.

The *Avalanche*, of April 14th, says:

Creek, gulch and hauk mining has fairly commenced.

Lime, of a fair quality, has been struck in Flint district.

The diamond excitement is still lively. Finer specimens than ever have been brought into Ruby City.

The Reynold's Creek coal has been fairly tested, and found a good article.

The Morning Star cleaned up $12,000 during the past week.

The Dardanelles have doubled labor on their ledge.

The New York *Mining Index* speaks of the stream tin from Jordan Creek as hardly to be distinguished from Cornish specimens.

The Owyhee *Avalanche*, of April 14th, speaks of the Gould & Curry, which it calls the father of ledges in Owyhee. We quote:

Tuesday last we made a personal inspection of what could be seen of this new discovery. Took a pick and examined the croppings from side to side, and found *forty-five feet* of quartz on the surface. The day previous several blasts were made at different points of it, and at all places the rock is the same and looks well. An assay of croppings made by Thomas McDonald gives per ton: Silver, $14.10; gold, $38.88—total, 52.98. We saw the rock which was assayed, and know it to have been only an average specimen.

MONTANA.

The Montana *Post* says: An assay of rock from the Rockfellow lode, in Rattlesnake district, made in this city (Helena), shows 993 oz., 1 dwt., and 8 grains of silver to the ton of ore, with slight traces of gold. The ledge, which is thirty feet wide between the wall rocks, was discovered last fall by Mr. S. Decker, and there is a shaft forty feet deep sunk on the discovery claim.

Blue Cloud.—Lode well defined, 8½ feet thick; shaft, 38 feet. Three-quarters of a pound of the rock yielded sixty-five cents. The owners have one of Dodge's improved mills on the way from the East.—*Radiator, March 31.*

A letter from Deer Lodge City to the *Post* says: Pack-train after pack-train is loaded at this and other places for Bear and Elk creeks. Deer Lodge, Virginia, Helena and Blackfoot merchants are on the move for those places; and immense quantities of merchandise are being rapidly taken thither.

Several two-story stone buildings are being erected at Helena.

A dispatch from St. Louis, dated March 16, says the emigration to Montana via Fort Benton, resembles the California ditto of '49.

Large tracts of land in Montana are now being plowed and sown with wheat, oats, and barley.

The Dalles *Mountaineer* says the White Bluffs route via Pen d'Oreille Lake, is decidedly the best for those going to Montana. The Walla Walla *Statesman* has heard of no one who thinks of going that way, and says crowds are going from Walla Walla via Boise City.

A letter dated Silver Bow City, Montana, March 19th, to a correspondent of the Marysville *Appeal*, says that the whole of Spencer & Wilmot's pack-train, consisting of seventeen mules, was frozen on the road from Bitter Root to Deer Lodge valley.

A letter to the *Post* from Bannock City, Beaver Head county, gives some account of the quartz in the neighborhood. In the Blue Wing district, northeast of Bannock, are the Huron, Blue Wing, Arizona, Wide West, and Silver Rose claims. To the north of this is the Rattlesnake district. The lodes here are rich in argentiferous galena. The principal ones are the Legal Tender, White Cloud, New World, Watson, and Dictator. South is the famous Ducotah. Beyond are the Canon, Camp Grove, True Flag, Golden Gate, and Quartz Mill lodes. The writer saying "that the day is not far distant when the yield of the precious metals of Beaver-Head county will astonish the world, and that Bannock and Montana cities will be the head of all mining operations in our Territory.

T. J. Butler, who spent the last season in Montana, says in a letter to the Red Bluff *Independent:* "This country is not what it was represented to be, although there are some good mines, and the extent of the mineral country is almost boundless. There is plenty of good agricultural land on both sides of the range. * * * * * The mines are so scattered that each district has its own depot for supplies, as wagons can run in every direction."

Seven or eight trains have started during the past week, from Tehama county, for Idaho and Montana.

The Sultana mill is being thoroughly rebuilt.

The *Post*, of April 14th, says: Mr. Smith, of Beaverhead, has shown us some fine specimens of Rattlesnake ore; among others, we specially noticed that of the Golden Gate lode, which is mainly silver ore, though assaying $59.68 per ton in gold. A deep shaft has been sunk in the ledge by Messrs. Smith and Graeter.

OREGON.

The Portland *Herald* says: Recent tests leave no doubt of the fact that rock sufficiently rich to pay well for investment and labor has been found within a few miles of the Columbia river, easy of access, with an abundance of timber and water privileges close at hand. We saw, yesterday, a certificate of assay by Wells, Fargo & Co., which resulted as follows: "330 pounds of rock assayed $2.11 gold, and 93 cents silver, 815 fine. Total, $3.33."

It is said that a rich vein of silver ore has been found to exist within the copper ledge twenty-five miles east of Grand Ronde Valley. The streak of silver-bearing rock is said to be thirty-six inches in width.—*Oregonian.*

ARIZONA.

Work was resumed on the Sterling lode, March 27th. The *Miner* of April 11th says they are finding rich rock.

Twelve hundred feet in the Capital lode, near Prescott, sold recently for two thousand dollars.

The following items are from the *Miner*:

In sinking the new shaft on the Bully Bueno lode the ledge has been struck at thirty feet deep very rich, and it is said fourteen feet wide. This, we think, is one of the best lodes in the country.

Messrs. Duppa and England have returned from a prospecting tour down William's Fork, and are said to have found some good copper lodes. They report a large population near the Planet and other mines on the Fork, which are now extensively worked and highly valued.

Robert Meacham, Esq., an experienced mining operator long resident in California and Nevada, and for some months past living in Prescott, is about to begin work upon his ledge, near the saw-mill, called the "Gold Hunter," and in close proximity to the well known lode of Messrs. Noyes, Curtis and others, the "Tenth Legion."

Messrs. Borger & Wunderlich, arrived here week before last. Mr. Borger has secured a first rate 10-stamp mill for the Eugenie and other lodes in the Big Bug district, in which he is interested with Theo. Boggs and others. It is expected at Hardyville at an early day, and will be put up without delay

We hear that the Thunderbolt Crusher mills are at Hardyville, and that wagons will go from here at once for at least one of them.

Messrs. Coulter and Tyson, are preparing a place for their mill on Lynx Creek. Mr. Wickenberg is doing well with his mill at the Vulture.

Colonel Woolsey's mill, to run by water power, and put up near his Agua Frio ranch, will be in operation during the present month. Arrangements are making for a mill on the Big Rebel and other lodes in Walnut Grove, and Mr. Hardy is to have a large mill to work the ore of his Southern Cross lode, near Hardyville. Work is progressing, and a mill will soon be put on the Moss lode.

A new gold bearing ledge has, it is said, been discovered about 100 miles from Prescott. Specimens purporting to be from this ledge have been exhibited in San Francisco. It is estimated to average $125 to the ton.

The Excelsior ditch and mining company has been formed, with ample capital, for the purpose of working the placer diggings on Lynx Creek. The fluming, etc., is nearly completed.

Mr. William Thompson, Superintendent of the Great Central copper mine on the Colorado, writes to a friend in Prescott: "I shall soon have my furnaces up, and if they work as well as they did in San Francisco it will be the best thing that has happened to the country, as I shall be able to work and send to market ore yielding as low as fifteen per cent., and at a very small expense."

COLORADO.

From the Denver *Journal*, we glean the following:

Mr. Fitzpatrick yesterday finished delivering at the Excelsior Mill, below town, six cords of Gunnell ore, for which he gets $1,800, half down and the remainder on Saturday. The cylinders at that mill, under the personal superintendence of one of the Crosbys, are said to do their work very well and at the rate of about a cord a day. There is still difficulty in the amalgamating however. The ball burnishers do not work satisfactorily and a Howell Crusher is to be tried for burnishing. The purchase of and payment for this batch of Gunnell ore indicates that the owners are certain in their own minds of success.

Mr. Ford has got his furnace running successfully in the head of Russell Gulch. He is getting out about 1,200 pounds of lead a day. We know nothing of the plan of the furnace, but suppose it not unlike those rude machines used in the lead regions.

Ten "cords" of ore worked by Behr & Keith, yielded $683, in gold, per cord.

Several companies are anxiously awaiting their turns at *the* mill, which is in constant operation on custom ore.

Mr. Truman Whitcomb is setting up one of Collum's Separators at his mill. Though highly spoken of, but one of these has as yet been opened in the Territory. This one will be ready for work in a week or two.—*Denver News, April 11th.*

UTAH.

The "Deep Creek" mines are now attracting attention. They were discovered in the fall of 1864; but very little work was done. The following year a copper mine was opened, the ore from which proved to be worth $380 per ton in San Francisco. This silver lodes, however, are regarded as the most important. The *Vedette* says:

The result of fifteen assays made by Mr. Hartzline, of Egan Canyon, from the croppings of the Emet ledge, gave all the way from $50 to $250, in silver, and $9 to 23 in gold, per ton.

The ledges vary from six inches to three feet in width at the surface, and as far as they have been developed increase in width downwards.

Deep Creek is about 185 miles west from Salt Lake City, on the Overland Mail Line, and the principal mines are about 33 miles from Deep Creek Station, on what is known as the Old Emigrant Road.

The *Vedette* of April 26, says, in reference to the Rush Valley mines:

The operations now in progress in Rush are characterized by energy and sagacity of purpose. Owners of ledges are availing themselves of every opportunity to develop and prove the value of their property. With each day's labor they behold increasing evidences of the value of their mines, and none doubt the future success of that district. Several furnaces are rapidly approaching completion.

BRITISH COLUMBIA.

The Dalles *Mountaineer*, of April 13th, says: Major Blake, late of Wells, Fargo & Co's Express, and Major Robinson, an experienced assayer, left the Dalles on Saturday last, for the Suswap country. These gentlemen go to superintend the working of a silver lode lately discovered there, and for which the British Columbia Gold and Silver Mining Company was recently organized in Portland.

Mole-hills are curiously formed by an outer arch impervious to rain, and an internal platform with drains and covered ways, on which the pair and young reside. The moles live on worms and roots, and bury themselves in any soil in a few minutes.

In 1720, at the commencement of the eighteenth century, there was not one in twenty of all the manufacturing and rural districts in England, who could read the Bible or write his own name. Sabbath Schools were introduced in 1773.

If a person sends you an insulting letter, send it back, after having raised your foot and put a *stamp* on it.

The streams of small pleasures fill the lake of happiness, and the deepest wretchedness of life is the continuance of petty pains.

It is Impossible for editors to know ALL the merits and demerits of their correspondence, consequently the reader must not receive the opinions of our contributors as our own. Intelligent discussion is invited upon all sides and the evidence of any error which may appear will be received in friendship and treated with respect.

American and Foreign Patents.—Letters Patent for Inventors can be secured in the United States and foreign countries through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past two years.

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the MINING AND SCIENTIFIC PRESS, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

Payment in Advance.—This paper will not be sent to subscribers beyond the term paid for. The publishers well know that a good journal cannot be sustained on the credit system.

Mr. Wm. R. Bradshaw, is our Special Correspondent and Traveling Agent. All favors or assistance rendered him in his progress through the country in behalf of our journal, will be duly acknowledged.

SAN FRANCISCO, Jan 1st, 1866.

Mr. A. C. Knox, is our fully authorized Traveling Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office.

SAN FRANCISCO, Jan 11th, 1866.

Mr. I. N. Hudson, is authorized to solicit subscriptions, advertising, etc., for the MINING AND SCIENTIFIC PRESS, in San Francisco, and to receipt for the same.

New Mining Laws of California and Nevada.

We have just issued, in cheap edition, the new laws relating to mining and corporations in California and Nevada, passed in 1865–6. Some of these laws are of the highest importance to parties interested in the matter of locating and holding claims, and prospecting mines, in these States. Copies sent by mail. Price, 25 cents.

Address, DEWEY & Co., Pateat Agents.
San Francisco, May 1st, 1866.

A ROCK-CRUSHING apparatus has been described as in use at Philadelphia for preparing the sand in the manufacture of sand-paper. It consists in a series of improved Chilian rollers. A set which weighs 8,000 pounds, and which costs in Philadelphia $4,000, is claimed to be sufficient to crush 100 tons in 24 hours. If this be *true*, it is exactly the machine we have been looking for in California, for quartz-crushing. The inventor can make his fortune here in a very short time, if he can demonstrate the fact. We think we see him.

TO CORRESPONDENTS.—An acceptable communication has been received from "W." We wish to see the author. Letter from Prof. Brewer of Yale, will appear in our next. M. A. W.'s specimens next week; ditto, "Query" of L. H. L.; "Progress," of R. R., soon.

NEW LAWS.—We are under obligations to Hon. James A. Banks, Speaker of the Nevada Assembly, for a copy furnished during the session, of the Act introduced by him, which we publish to-day. It is a very important law.

STATIONARY ENGINES.—We would direct attention to this class of machinery represented in the advertisement of Messrs. Treadwell & Co.

Our senior editor has been taking notes in Placer and Nevada counties this week.

OUR MINING SUMMARY this week presents an extensive variety.

QUARTZ MINING IN COLORADO.

The *Weekly Mining Journal*, of Black Hawk, Colorado, under date of March 27th, has two articles upon the mining prospects of the Territory. It gives particulars regarding extensive, incipient or projected operations in various localities, and considers the prospects decidedly bright. It is, however, justly severe upon the system of exaggeration that has been so unscrupulously practiced with respect to the present status and production of the mines. Upon this point it speaks as follows:

"For our part, if the Territory shall altogether produce five millions' worth of bullion this year, we shall be vastly encouraged. It will be better than was done in both 1864 and 1865 together. We do not think it an extravagant estimate. * * It is time that this extravagant talk about hundreds of mills in Colorado stamping out from twenty to forty millions a year should cease. It only injures us. There are not twenty mills in the Territory that could run successfully to-day, and a production this year of five millions, although seemingly meager in the light of the gas heretofore emitted on the subject of our gold and silver yield, would be most superlatively encouraging in the light of truth. It is perhaps not too much to say, certainly not too much to hope, that it would be doubled next year."

It says further—

"Why try to couple the success of our mines with the success of a single method of treating ores? And why, upon its inauguration, assume in effect that we never produced any gold before? And why, we might ask, in estimating our production, is it necessary to always put it five or ten times as high as it is, so that the truth, which must appear sooner or later, shall be so cooling and disappointing? If Colorado produces five millions of bullion this year, we shall be satisfied, and the country may well be."

It also publishes the following—

Figures.—It is earnestly to be hoped that one or more of the various separating processes now being tried in that Territory may prove thoroughly successful. The accounts from those of Mr. Lyon and Mr. Keith are very encouraging; but capitalists and the mining public generally desire to know something more than the mere fact that this process or that one turned out a bar of bullion weighing say one hundred pounds. They want to know the number of tons of rock from which that one hundred pound bar was extracted, and what it cost to extract it. These are the points by which they will measure success or failure. We do not wish to doubt the success of Mr. Lyon's process, for instance, but knowing how important it is to Colorado mining interest, *we cannot help suggesting to the press of that Territory the propriety of ascertaining and publishing the figures as to the quantity, cost, time, etc.* We are satisfied that Colorado will yet come out gloriously from her trials, and such an exhibit, if favorable, will hasten the time.—*American Mining Index.*

Lyon is in New York just now; suppose you try your hand at ascertaining "figures as to quantity, cost, time, etc." Be sure you get the truth; if you have to take any man's word, verify it if possible, and remember that whatever you report you are responsible for. Then give us the immutable figures, and we will acknowledge the pertinency of your numerous suggestions to the press of Colorado.

There seems to be a little captiousness in these remarks of the *Journal*, which is, perhaps, uncalled for.

It is without doubt, in general, extremely difficult if not impossible to obtain full and reliable data as to cost, etc. Parties engaged in working difficult ores are apt to be reticent upon such matters, and as far as it affects their private interests, they have the right to be so. Too much mystery in such matters, however, always smacks of ignorance or humbug, and proprietors of really valuable processes, as well as journalists, should always remember that nothing can be so convincing as facts like these; that general statements cannot supply their place, and that *so far as it can be done without prejudice to private interests*, it is of the utmost importance to all concerned that the truth in such matters should be known and circulated as widely as possible.

The *Journal* is very enthusiastic in its belief in the full and complete success of the Keith desulphurizing process. We shall, perhaps, be more fully convinced of this when it has been more extensively tested, and more detailed results have been published. As yet we have serious doubts respecting it.

There is a spirited contest going on between the same journal and a certain John Wetherbee of Boston, as to the merits of the Crosby and Thompson desulphurizing process, the *Journal* being of opinion that this process is "a most consummate humbug."

Without entering into the merits of this dispute, which is largely personal, and in which it may be difficult to learn the exact truth, we will say that we are somewhat inclined to agree with the *Journal*, as to its opinion of the process in question. We have already published descriptions of this process and comments upon it.

The talk put forth in connection with it, as to the existence of gold *in a volatile state* in sulphurets, the *ignoring of specific gravity*, etc., is too absurd to be seriously proposed to any one having a knowledge of the facts of chemistry and of the simplest elements of mechanics.

NEW INVENTIONS.

Most of the following list of Patents, recently issued to Inventors on the Pacific coast, were secured through the MINING AND SCIENTIFIC PRESS PATENT OFFICE AGENCY. Full copies of claims and specifications can be procured by application to us.

ARCHITECTURAL DESIGNS.—Samuel Kellett, of San Francisco, three patents for architectural center flowers. These designs are beautifully wrought, after natural patterns of the California fruits and flowers, and are of an order of high *alto-relievo*, rarely if ever attained before.

IMPROVED ROOFING COMPOUND.—George Duncan, of San Francisco, claims the preparing of burlaps with a tarry and bituminous compound, and covering the same with bituminous compound, in the manner and for the purpose set forth.

COVERING FOR HYDRAULIC HOSE.—Thomas McAuley, of San Francisco, and M. L. Cheney, of Illinoistown, California, claim the forming of a hose covering, by winding rope or cord spirally around a cylinder or former, and having for its support warps or strands of rope or cords passing around each spiral strand by means of a half twist, substantially and for the purpose herein specified and set forth. This invention relates to the covering of the common duck or canvas hose (used for hydraulic mining), with a net-work of cords, and consists in winding the cordage or rope, which constitutes the woof of the covering, spirally around a form of the desired size. Other strands are placed at right angles with the spiral strand, arranged in pairs, and are made to cross each other with a half twist, between each spiral of the woof. This invention is said to have been very successful in its practical tests.

DOUBLE-ACTING PUMP.—Assaria Rewerick, of San Francisco, claims the cylinders H and M, and pistons H and N, with their valves, when arranged and operated substantially as described. The above relates to an ingenious development for pumping, whereby the water is raised in a constant stream both by the upward as well as the downward stroke of the handle, by the employment of one cylinder and piston-rod—the upward stroke lifting the same quantity of water as the downward stroke of the piston forces up.

PUMP.—L. A. Gould, Santa Clara, California, claims connecting the rod, *h*, and hollow sleeve, *l*, respectively, of two buckets, *f*, and *f*, *c*, of a pump, to a common actuating lever handle or brake, on which the rod, *h*, is hung, through the sector-shaped gears, *s* and *t*, and arm *u*, all arranged and operating as and for the purpose specified.

PADDLE WHEEL.—Edward Jones, of San Francisco, claims a paddle-wheel provided with floats, convex on their outer edges, and increasing in width towards the outer ends, arranged relatively to the wheel shaft and to the sails of the vessel, substantially as described and set forth.

ORE CRUSHER.—Zenas Wheeler, of San Francisco, (anti-dated Feb. 19th, 1866,) claims the combination with the stationary jaw *g*, of the movable jaw *s*, when the latter is operated by the cam shaft, *o*, and adjusted at its lower end by means of the screw bolts, *t*, *t*, which are hinged thereto, and adapted to produce the motion described. Second, making the jaw dies in two or more sections or parts, substantially as herein described and for the purposes specified.

QUARTZ CRUSHER.—John Fleck, Santa Cruz, Cal., claims the two jaws A, A, provided with two upper inclined parts, *a*, *a*, and lower vertical parts, *b*, *b*, in connection with oscillating frame or walking beam B, and frames F, F, all arranged to operate in the manner substantially and for the purpose set forth. Second, the combination of the jaws, A, A, oscillating frame, B, and wheels *f*, *f*, for securing the upper ends of the jaws in the frame, as herein specified.

GOLD AND SILVER WASHING APPARATUS.—Joshua Hendy, of San Francisco, claims, first, the guide fingers, T, T, attached to distributur, G, working in slides V, V, or their equivalent. Second, the riffle bars, R, R, coated with mercury, for the purpose as herein set forth. Third, that the riffle bars R, R, guide fingers T, T, and slides U, U, in combination with distributor, G, and pan, B, with convex bottom, and central outlets, E, E, substantially as described, and for the uses and purposes as hereinbefore set forth.

ACKNOWLEDGMENT.—We have received from Mr. A. Sutro, who goes East by the next steamer, a copy of a magnificent lithograph, illustrative of the ridge in which the Comstock ledge is situated, and giving a plan of the proposed Sutro Tunnel.

We have also received a copy of a beautifully printed pamphlet on the subject of the Comstock, containing the report of T. Baron Richthofen, Doctor of Philosophy, to the Board of Trustees of the Sutro Tunnel, by whom he was employed in his professional capacity.

Both of these works are deserving of a more extended notice than our time and space this week will allow. We hope to do them justice in our next issue.

THE "LITTLE GIANT" QUARTZ MILL.—This machine, of which, it will be remembered we gave a description a few months ago, has met with favor in Ruby City, Idaho. H. A. Jones, Treasurer of the Cosmos silver mining company, No. 158 Broadway, New York, has received a letter from the financial agent of the company in that place, announcing the fact that one was started into full operation there on the 15th of February, and that it was pronounced a perfect success. With a driver of 8-horse power, it is reported to have pulverized one thousand pounds of ore per hour, to a sufficient degree of fineness to pass through a sieve containing 5,000 meshes to the square inch. This is said to be only one-half of its capacity if accompanied by a *crusher*, as delineated in the cut accompanying the notice in the PRESS, to which we have referred. R. H. Vance, 25 Nassau street, corner Cedar street, New York, receives orders there for the machine, and S. B. Pike, inventor, at the Miner's Foundry, for the same in San Francisco.

THE "AMERICAN JOURNAL OF MINING."—This is the title of a new weekly journal of sixteen pages, published in New York, the first two copies of which we have just received. Its salutatory address is brief and modest; making no special promises, except that politics, being entirely "incompatible with the spirit and scope of such a paper," will be utterly ignored. The typographical execution of the paper is remarkably neat, and its mining summary very complete. The subject of petroleum very properly receives a large share of its attention; and oil companies, as well as gold and silver mining companies, are tabulated in a very convenient form.

A FISH, four inches long, and without eyes, was pumped out of an oil well at Pithole, Pa., a short time ago. The well was six hundred and sixteen feet deep. The fish was put into water, but lived only a few hours.

IN addition to other machinery being erected in the Rawhide Ranch mill, Tuolumne county, our special correspondent should have mentioned in his communication last week, four of Hendy's Patent Improved Concentrators.

[Written for the Mining and Scientific Press.]

The Cement Mills and Claims around You Bet.

Messrs. Editors:—Seeing in a recent number of your valuable paper some mention about cement claims, and your wish for some reliable information concerning them, I will take pleasure in giving you some from personal experience and observation. There is in this State probably no section so rich and extensive as the vicinity of You Bet, in this description of mining ground. As an evidence of this, I have only to state the fact, that within the circuit of two miles of this place there are thirteen mills in active operation, crushing cement gravel. I will give you some account of the results of these mills and their crushings:

First—Edward Williams & Co., a 12-stamp steam mill, joining the well known Mallory & Co's claims, cleans up from $1,000 to $2,500 per week, and the average expenses amount to about $600 per week.

Second—Brown Bros & Co., an 8-stamp mill, driven by the so-called hurdy-gurdy water wheel. This company has made splendid runs, from $1,000 to $3,200 per week, with an average expense of about $500 per week. This is a very large claim, and is good for a number of years.

Third—Neece & West, a 10-stamp mill, with improved hurdy gurdy wheel water power. This company, about the first of January last, struck some of the richest blue gravel ever met with, and are cleaning up from $3,000 to $10,000 per week, at an average weekly expense of about $600. This has always been considered the best paying claim here, for it has been paying and worked continually about fourteen years. Its superiority over other claims consists also in the fact that after drift out their bottom bed of blue gravel, it will, by the breaking of the hill, be one of the best hydraulic claims in the State, for the top stratas have always paid large for piping. The blue gravel is actually as rich, if not richer, than the celebrated blue gravel claim in Smartsville, Yuba county, with which mine I have been acquainted since 1855. But, as you well know, a claim that is worked by such heavy blasting and with such a large quantity of water as the Smartsville claim uses, must in the same amount of time wash out ten times as much gold as a 10-stamp mill can crush out with one man feeding it. The quantity of dirt crushed in such a mill in one week could be washed in the Smartsville claim with 600 inches of water, in a couple of hours, if not in less time.

4th. Buckman Bros. & Co.; an 8-stamp mill, hurdy wheel power. This company is making money steadily, taking out from $800 to $2,000 per week with an average expense of about $450. This is an extensive claim, and will last a very long time, and is the first claim which tried the hurdy water wheel, as applied to crushing mills. They proved it a perfect success by running eight stamps of 800 pounds each, seventy-five drops per minute, with thirty inches of water, under 230 feet pressure (this being the average pressure obtainable by all the claims using mills here.)

But perhaps I am making this article too long, so much so as to prove troublesome; therefore I shall stop, as it would require much more space than you will be able to devote to a single letter, to give you anything like a brief account of all the mills and claims in this vicinity.

Should you see fit to publish this you can do so, and let me assure you that the above are strict facts, and can be easily ascertained. If acceptable, I will take pleasure in sending you some further accounts from the

Blue Lead.

You Bet, Nevada Co., March, 1866.

Coppersmith Work.—James Mucken, No. 226 Fremont street, is now engaged in manufacturing an evaporating worm for a sugar plantation on the island of Tahiti. The Miner's Foundry Co. are getting up the machinery for the sugar mill. Mr. Macken is also getting up the copper work for the opposition side wheel steamboat, now being built at North Beach, for the Sacramento river.

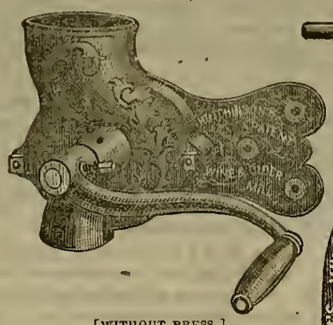
[Extract from Circular printed at the Mining and Scientific Press Book and Job Printing Office.]

HUTCHINSON'S
WINE AND CIDER MILL,

(PATENTED FEBRUARY 3d, 1863.)

FOR SIMPLICITY, COMPACTNESS, STRENGTH, ECONOMY OF POWER, QUALITY AND QUANTITY OF WORK, IT CHALLENGES COMPETITION.

IT WILL CRUSH THE FRUIT PERFECTLY FINE AND NOT CRACK A SEED, GRINDING TEN TONS OF GRAPES, BERRIES OR TOMATOES, OR SIX TONS OF APPLES, PER DAY.



[WITHOUT PRESS.]

[WITH PRESS.]

SOLE AGENT

FOR THE

PACIFIC COAST.

MANUFACTURED BY

WILLIAM B. KNOX,

At the GOLDEN STATE IRON WORKS,
19 FIRST STREET, SAN FRANCISCO.

Testimonial.

The "Scientific American," December 6th, 1862, in speaking of this Mill, says:

"We have seen it at work, and can give personal testimony as to its efficiency, having had it in operation in our office. All the labor consists in turning the handle to grind the apples into pomace or the grapes into must, as it is applied to cider or wine manufacturing; the juice then flows, by the combined operation of pressing and grinding, in a continuous stream at the rate of a barrel an hour into the tub below."

Evening Schools.—The Board of Education has very wisely continued the most of the classes of this department throughout the Summer. Mr. Holbrook's English class, on the corner of Broadway and Montgomery, and Mr. Marriner's, and one other in the Lincoln building, will be continued. The two classes for foreigners learning English, will be consolidated, and continued under Mr. Ralph Keeler, in the old Normal School building, on Post street, until further notice.

Wine and Cider Making.—We have just printed a pamphlet circular referring to the above named subject, for Wm. B. Knox, agent for Hutchinson's wine and cider mill. An illustration of the mill will be found in our advertising columns. Copies of the circular sent free on application to the Golden State Iron Works.

Arithmetic.—We know nothing of the earliest history of the ancient mathematical art of treating of numbers, but we know that, like all other sciences, it originated with the Greeks, who called it the art of reckoning, and named the science arithmetic. It would not be easy to find many clerks who resort to it as an amusement, and yet Dr. Johnson, with the most profound sincerity, declares: "Nothing amuses more harmlessly than computation." Nothing is more often applicable to real business or speculative inquiries. A thousand stories, which the ignorant hear and believe, die away when the computest takes them within his grasp. Numerical inquiries give entertainment in solitude by practice, and reputation in public by the effect.

The Age for Pupils.—The School Census upon which the apportionment of School moneys, after this year, is to be made, is to be of the children between five and fifteen years, instead of four and eighteen as heretofore. The limits of age during which children may attend the Public Schools will be from five to twenty-one in the future, instead of from five to eighteen years, as in the past.

State Normal School.—This institution will close on the 7th of June. The exercises of the graduating class will be held in Lincoln Hall. Mr. Minns, the Principal, goes East on a visit, having been granted a leave of absence for five months. The pupils of the School and the Teachers of the city will unite in giving him a complimentary party on Friday evening, June 8th, in the Hall.—*California Teacher.*

For the Sacramento Trade.—At Capt. North's shipyard, on the Potrero, a sternwheel steamboat of small size is being constructed for the fruit trade on the Sacramento river.

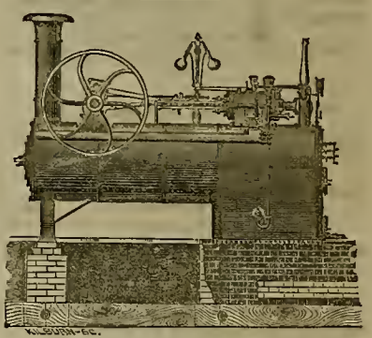
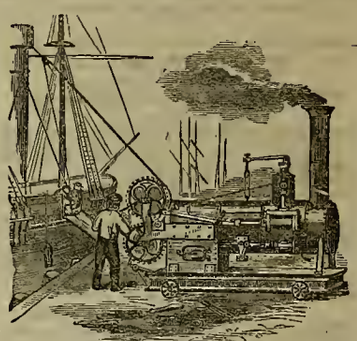
Portable Steam Engines!

"Hoadley's" and "Hittinger's" Make,

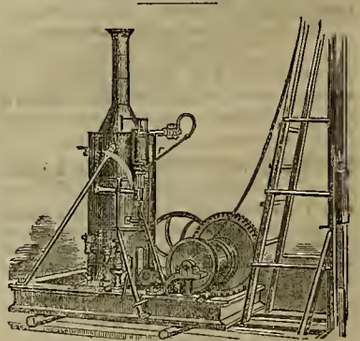
FOUR SIZES,
8, 10, 12, and 15-Horse Power,
HOADLEY'S.



HOADLEY'S.
3 to 40-Horse Power.



HITTINGER'S.
THREE SIZES,
5, 7, and 10-Horse Power,



HITTINGER'S.
TWO SIZES,
5 and 7-Horse Power,

COMBINING THE MAXIMUM OF EFFICIENCY, DURability, and Economy, with the Minimum of weight and price.

These Engines are favorably known, a large number being in use on this coast for hoisting, pumping, threshing, milling and mining purposes.

Steam can be got up on these Engines in fifteen minutes after reaching the place of operation, and the time, expense of setting boilers, machinery, and "construction account" saved, (which is often the difference between the successful and unsuccessful prosecution of milling enterprises.) In fact, the portable principle is the pioneer's friend, and enables him to draw engines on their own wheels to his cabin door, and plant on the outermost confines of civilization the saw and grist mill, and it has done and will do more to help subdue the continent than any other of the modern motors which are crowding society and normalizing the world.

All sizes on hand from 3 to 30 horse power, with and without carriages.

Also, Portable Saw and Grist Mill's.

For sale by TREADWELL & CO.,
18v12 Corner of Front and Market streets.

Metallurgy.

EUROPEAN METALLURGICAL WORKS,
—AND—
Practical Mining School,
Bryant Street, Between Third and Fourth,
SAN FRANCISCO.

THE Proprietors are at all times prepared to work or test Ores sent to this establishment—either in large or small quantities—by such process as may be found best adapted to their chemical character, after a careful analysis has been made. Test lots of Ore adapted to the smelting process attended to. Sulphuret, pyritous, and the (so-called) "rebellious ores," are having especial attention paid to their successful treatment. Assaying in the humid and dry way. Also, refining by cupellation, done at moderate rates.

PRACTICAL MINING SCHOOL.

The proprietors—encouraged by numerous applications from gentlemen desirous of pursuing the study of practical metallurgy—have concluded to admit parties on reasonable terms. Having in their Mill all the necessary appliances for crushing, roasting, amalgamating, smelting, refining and assaying, as also a well extended Laboratory for the analysis of Ores and Minerals, a good opportunity is here offered to acquire a sound practical knowledge of the business.

S. P. KIMBALL, J. R. MURPHY.

[Written for the Mining and Scientific Press.]

From El Dorado County.

BY OUR TRAVELING CORRESPONDENT.

[Continued from Page 267.]

One mile southerly from the Red Hill claim, lying along the bed of Dutch Creek, and two miles southwest of Kelsey, is

THE PLYMOUTH CLAIM,

Which we have deemed advisable to notice in this connection (although last visited), in view of the sulphurets and arseniated sulphurets of iron alluded to before, but here found in the greatest abundance, and in every imaginable variety. All sizes, shapes, shades and states are represented, from the little irregular sulphuret of different mineral bases—dark, gray, or yellow, and of almost every hue—living, lifeless, decayed—so small as only to be seen with a glass of considerable magnifying power, to a large wedge-shaped mineral compound, containing certain proportions of iron, sulphur and arsenic, if not other minerals; a hard, dark-brown substance, somewhat fusible and of such magnitude as in some instances, perhaps, to weigh fully fifteen pounds, one piece being eighteen inches wide, four feet long and one foot thick. Some of it having been brought to a red heat under the blow-pipe, showed, in cooling, a surface dotted over with delicate little specks of gold, less brilliant than the native specimens to be seen in the quartz; but scarcely less beautiful and attractive to the eye of the curious. This species is always found here firmly attached to a tough black slate, somewhat glazed and crisped, apparently its natural casing, whether found as the wall of the lode, or as strata cutting the quartz. The company have sunk a shaft to the depth of fifty feet on the lode, which is from twelve to fourteen feet wide, and have about 1,000 tons of rock ready for crushing, estimated by Mr. Potter, the Superintendent, to average from $20 to $25 per ton. They have a small 2-stamp mill, pump, arastra, and concentrator—the stamps not weighing over sixty pounds each—and all are run by twenty inches of water, the diameter of the wheel being about twenty feet. The sulphuret separator or concentrator is an invention of Mr. M. M. A. Woodside, of Georgetown, cheap, simple and effective, and as he has made application for a patent, we shall not undertake a description of it; 2,500 pounds of the arsenite, worked in San Francisco, returned at the rate of about $150 per ton. Messrs. Potter & Hunsucker, at the mine, tested 150 pounds of it after a method of their own, and assured me that they obtained one dollar per pound, getting a much larger yield from some of the sulphurets, which ran, in some instances, as high as five dollars per pound. The affairs of the company are in a very good condition as regards their finances, the whole of the work done, and the improvements made at the mine, having been paid for by the product of the same, while they have some money in the treasury. All they need is a good engine and mill, guided by the same prudence and economy heretofore manifested in their operations, to make this one of the foremost mines of the county, if we can judge anything from its past history and present indications.

About midway between the Plymouth mine and Kelsey, on the range of the great mineral belt, supposed by many to extend with a width of some ten miles along the western slope of the Sierras the whole length of the State, a large ledge may be seen from a distance of miles around, crossing the country from north to south, and cropping boldly out on hillside or mountain top, displaying here and there very large masses of quartz boulders—with heap on heap—reminding one of Vulcan and his once burning forge, or of some powerful internal eruptive force, adequate to produce the effects here visible in the form of the vast blows or chimneys so often brought to view. Near one of these is situated the claim of

THE GOPHER MINING COMPANY.

Under the guidance of Mr. Higgins, the Superintendent of the works, I passed along the main tunnel, well and substantially timbered the distance of 256 feet, and through cross-cuts and drifts, until I had traversed a distance in the aggregate of 500 feet, mostly through quartz, which is thought to be worth from eight to twelve dollars per ton, some thirty tons having worked the latter amount

One large chamber of sixty feet square had been carved out of the solid mass and worked in former years, with what results I did not learn. The statistics (promised by some of the officers of the company), many of which would have been of public interest, never came to hand, which is to be regretted, for if this large mass of quartz will average the amount above stated, and given on the authority of the Superintendent, it will prove one of the grandest enterprises of the day, for the ore can be mined and worked at a cost of five dollars per ton. The quartz boulders on the surface contain free gold, and the time is not far distant when they may all pass under the stamps. There can be no doubt that there is in this mine a large amount of valuable ore, which may prove highly remunerative to the owners, if properly selected and economically worked.

Leaving it as I believe in trustworthy hands, I remain, as ever, your faithful

PROSPECTOR.

Kelsey, El Dorado Co., April, 1866.

AN OLD CLOCK.—A descendant of one of the oldest families in Leicester is in possession of a clock which has been in the family ever since the first settlement of the town in 1717. It being still in its prime as a timekeeper, and an elegant piece of furniture, it is not strange that it should be in demand by other members of the family. A few days since a wealthy relative offered the owner one hundred dollars for it, which was the original cost in London. He was told that if he would add six per cent. compound interest since its purchase he might have it. On computing the sum it was found to be over eight hundred thousand dollars.—*Worcester (Mass.) Spy.*

THE PACIFIC IRON WORKS,

First & Fremont Sts., between Mission & Howard, San Francisco.

The proprietors of the above Works invite the attention of all parties interested to their greatly improved and unequaled facilities for manufacturing Steam Engines and Boilers, both Marine and Stationary, of any required size and pattern, Quartz Mills, Amalgamating, Pumping and Hoisting Machinery of the most approved construction. Flour, Saw, and Sugar Mills, Water Wheels, &c., &c. Our pattern list is most complete and extensive, embracing the late improvements in all classes of machinery adapted to use on this coast. We would call especial attention to the fact that we have secured the exclusive right of manufacture for the Pacific Coast of the celebrated Greene Engine, conceded to be the most economical and perfect working Engine now in use. We are also exclusive manufacturers of the celebrated

Bryan Battery, Varney's Amalgamators and Separators, Ryerson's Superheated Steam Amalgamators and Rotary Crushers, Stone Breakers, &c. Orders respectfully Solicited.

GODDARD & COMPANY.

REMINGTONS' ARMY AND NAVY REVOLVER,

THE REMINGTON REVOLVER

Has been approved by the United States Board of Ordnance, and has so satisfactorily met the requirements of the Government, not only in the field, but in the official tests and examinations made by prominent officers of the Ordnance Department, that it stands at once the most popular, serviceable and approved arm of the kind in use. Upwards of 125,000 have been supplied to the Government within the past four years, for the land and naval service, furnishing ample evidence of the estimation in which the arms are held.

Simple and symmetrical in its entire construction, securely strong, of most modern improvement in mechanism and material; its unequaled range and penetration, together with its durability, are points in its favor now well known, and which challenge a comparison with any other pistol of the kind made in this country or in Europe.

The superior strength and capacity of the arm for constant and long use is apparent from the fact that the entire frame is constructed of a single piece of metal, thus preventing the extension of some portions of the frame, from the effect of firing—a serious defect in many pistols—in which the frame is composed of two or more parts.

The frame of the Remington Revolver furnishing a TOP STRAP or support above the cylinder, served to protect the base pin (on which the cylinder revolves) from any undue strain to which it would otherwise be subjected, and which would immediately render the line of fire from the cylinder to the barrel imperfect, thus destroying force and accuracy.

Another advantageous feature of the arm is the means afforded for the instantaneous removal of the cylinder from the frame. This not only facilitates the cleaning of the pistol, but by the quick adjustment of the cylinder, one pistol can be made as effectual as two—and, considering the difference of weight, it is far preferable—by simply possessing a spare cylinder loaded and capped to instantly replace the exhausted one.

The above is a general summary of the points of peculiar merit in the Remington Revolver which a trial of the arm is only needed to attest. For sale at Manufacturers' rates, by

16v12 **ALBERT E. CRANE, Manufacturers' Agent, 310 Washington Street, up stairs.**

Vulcan Iron Works Company

[ESTABLISHED 1850.]

First, Natoma and Fremont Streets.

IRON FOUNDERS,

Steam Engine and Locomotive BUILDERS,

Boiler Makers, and Workers in Sheet Iron, Brass and Copper.

These Works have lately been increased by the addition of new shops on Fremont Street, doubling the capacity of the original establishment. Their facilities for turning out machinery promptly and efficiently, are now unequaled in the State. Their Boiler Works have also been enlarged correspondingly.

The Company are prepared to execute orders for all classes of Machinery and Boiler Work, such as

Mining, Steamship, and Steamboat Machinery,

Railroad Machinery, Locomotives, Car Trucks, Car Wheels, Housings and Irons; and Flouring Mills, Quartz Mills, Sugar Mills, Saw Mills,

Manufacturing Machinery of Every Kind.

Sole Manufacturers of

SUBSCRIBERS who do not receive the MINING AND SCIENTIFIC PRESS in due time, are requested to inform the publishers.

BY MAIL.—The MINING AND SCIENTIFIC PRESS will be sent by mail to any part of the civilized world. In case of removal, subscribers have only to inform us of the post-office address of their old and new location, and the paper will be sent accordingly.

It is filled with reliable, useful and interesting matter, and to our miners who wish to understand the theoretical, as well as the practical part of their business, the MINING PRESS will be found an invaluable aid.—[Nyo County News

---

VOLUME TWELFTH.—The MINING AND SCIENTIFIC PRESS, with its last issue, commenced its twelfth volume. Since Dewey & Co. have "held the ribbons" its gait has been rapid towards a perfect journal. Its appearance evidences its prosperity, but doubtless, like some of the rest of us, it can stand increased encouragement. Let such be given, and, our word for it, volume thirteen will acknowledge receipt.—[Golden Era.

1852. 1866

A NEW VOLUME.

Fourteenth Year of Publication.

THE GOLDEN ERA.

Founded in 1852.

The oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent, and correspondents and contributors of distinguished ability in New York, Paris and London.

Miss BRADDON'S Greatest Sensation Story published from Advance Sheets:

RUPERT GODWIN;

—OR—

The Secret of Wilmindou Hall.

A NOVEL.

By Miss M. E. Braddon,

Author of "Lady Audley's Secret," "The Outcasts," "The Doctor's Wife," "Three Times Dead," etc.,

—IN—

THE GOLDEN ERA.

NOW IS THE TIME TO SUBSCRIBE!

THE GOLDEN ERA is now enlarged by the addition of eight columns to its pages—and presents fifty-six columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected Matter, all combining to render THE GOLDEN ERA a Literary and Family Journal of surpassing interest and attraction; a Welcome Guest in Cottage and Cabin—the favorite at the fireside in City and Country, the most useful, agreeable altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe, and elsewhere. Every Household in the Mountains and Valleys, the Cities, Towns, and Mining Camps of California and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor.

Serial Romances in The Golden Era.

The most popular Novels of the present day published as Serials, from week to week, in the GOLDEN ERA, from advance sheets, simultaneously with their appearance in the English and Atlantic Periodicals.

Among the contributors to the GOLDEN ERA are all the prominent writers of Literary Repute in California and on the Pacific Coast, also correspondents and contributors of distinguished ability in the Atlantic States and Europe, comprising an array of Talent and Genius unapproached by any Literary Journal in California, the Atlantic States, or Europe.

TO ADVERTISERS.

Best Advertising Medium.—The Golden Era is the oldest Weekly Journal in California, and indisputably enjoys by far the largest circulation in the city of San Francisco and in the interior of the State.

THE GOLDEN ERA

Is universally read in every city, town, village and mining and agricultural precinct in California, and offers unusual and unequalled advantages to those who desire to bring their business prominently before the community. Only a limited space is devoted to advertising. All advertising pages are also largely occupied with fresh and interesting reading matter, and no advertisement can escape attention. The charges for advertising are not so large, proportioned to the benefits derived, as those of other papers. Liberal terms will be made with those who advertise for three or six months, or by the year.

Judicious Resolutions.

Several of our most substantiul and judiciously managed mining corporations have passed resolutions, since the approval of the new assessment law, requiring all notice of assessments and sales to be published in the MINING AND SCIENTIFIC PRESS, the only thorough (daily or weekly) mining journal on this coast. Our efforts to concentrate all mining advertisements in one paper, for the economical convenience of shareholders and assessment payers, are meeting with decided success. Those who believe in supporting the mining cause, should bear our paper in mind, and bring up this subject at the next trustee or shareholders' meeting.

San Francisco, April 7th, 1866.

MANY WORDS adopted permanently in our language have been derived from proper names. For instance: bayonet is from *Bayonne*, the name of a French city in which bayonets were first made. Meander is from the river *Meatder*, in Phyrgia which is noted for its winding course. Millinery is so called because articles of that kind were first imported from *Milan*. Calico is from *Calicut*, so called because first imported from that place.

A NEWLY arrived John Chinaman in California purchased some ice, and finding it very wet laid it out to dry in the sun. On going to look for it again he found it had disappeared, and forthwith accused the whole Chinese neighborhood with larceny. A general riot was the consequence.

ELEVEN hundred and sixty three new species of fish were discovered by Prof. Agassiz in the course of his explorations on the main stream of the Amazon.

MR. H. P. CARLTON has been promoted to the Principalship of the State Normal School, during the absence of Mr. Minns.

J. B. CONE, BUSINESS AGENCY.—Makes private sales of Property and Business Places of every description, in the city and throughout the State; procures partners with large and small amounts of money; negotiates sales of mining property, and does a General Agency Business. Patronage solicited by mail, express, or by personal application at the office, 402 Montgomery Street, San Francisco, California. 23v11tf

New Mining Advertisements.

Continued Mining Advertisements will be found on another page.

Capitola Gold, Silver and Copper Mining Company, Uvas District, Santa Clara County, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 30th day of April, 1866, an assessment of ten cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, or to E. H. SWARTHOUT, Treasurer, San Jose, California.

Any stock upon which said assessment shall remain unpaid on the 12th day of June, 1866, will be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 2d day of July, 1866, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

D. R. BECKFORO, Secretary.

Office, 731 Clay street, San Francisco, Cal. my5

Dios Padre Gold and Silver Mining Company, Alamos, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 28th day of April, 1866, an assessment of three dollars per share was levied upon the capital stock of said Company, payable on the 29th day of April, 1866, in United States gold coin, to the Secretary, E. C. McCOMB, No. 1 Government House, corner Sansome and Washington streets, San Francisco.

Any stock upon which said assessment shall remain unpaid on the 5th day of June, 1866, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 23d day of June, 1866, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

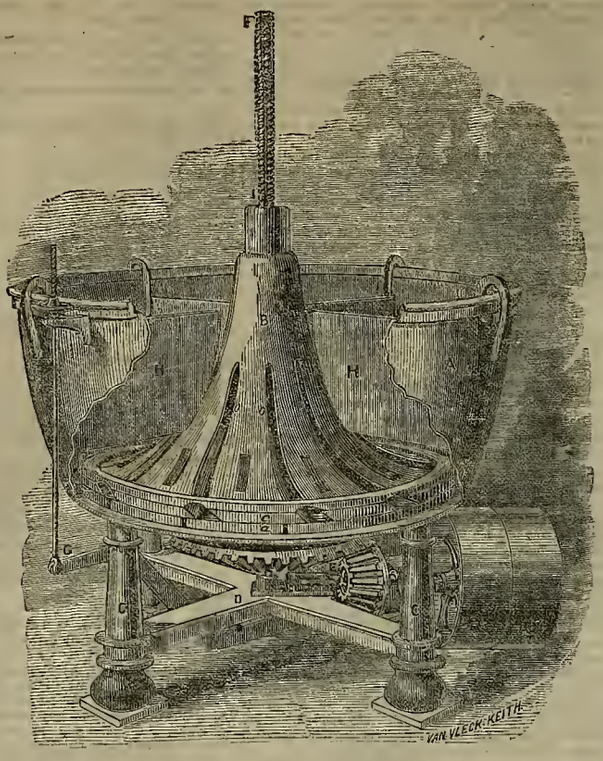
THE EXCELSIOR
GRINDER AND AMALGAMATOR.

In the engraving herewith presented, A represents the Rim of the Pan; B, Muller; C, Legs; D, Cross-Frame; E, Gearing; F, Screw; G, Lever; H, Dash-Boards; I, Key; *a*, Dies; *c*, Shoes, and *o*, Openings,



The relative grinding capacities of "The Excelsior" Grinder and Amalgamator, of the Flat Bottomed Pan, and of the Conical Pan *when properly constructed*, are respectively 177, 98 and 110.

That is, the respective mullers being of the same diameter, same weight, same hardness, and running at the same velocity "The Excelsior Grinder and Amalgamator" will reduce one hundred and seventy-seven tons of ore, the Flat Bottomed Pan ninety-eight tons, and the Conical Pan one hundred and ten tons to the same degree of fineness in the same time.

The wear to the Shoes and Dies at their grinding surfaces in the Excelsior Grinder and Amalgamator, is perfectly uniform, thus securing evenness of reduction to the pulp, as well as steadiness of motion to the muller. Uniform wear of the grinding plates has been attained in no other than that of the Tractory form—nor can it be.

Another property of excellence in this machine is that the metal or substance to be amalgamated passes *direct* from the grinding surfaces into the quicksilver; thus excluding the possibility of its becoming coated with any foreign substances, after having been burnished. It is truthfully said "that the Tractory-formed Pan as a Grinder has no equal, and as an Amalgamator no superior."

As a whole, it is far superior to any other pan in use.

MANUFACTURED AT THE

Union Iron Works and Golden State Iron Works,

WHEELER & RANDALL, Inventors.

The undersigned having had several years of experience in practical quartz mining operations, will ever take great pleasure in furnishing parties interested in mining and machinery any desired information which they may possess.

Machinery.

"Safety Cages."

(PATENT GRANTED.)

MINING COMPANIES

WILL FIND IT TO THEIR INTEREST TO ADOPT "Berry, Hochholzer & Denver's Safety Cage" in their hoisting works. It requires very little more work to manufacture than the ordinary style of cages—any blacksmith can make it. It has been PROVED TO BE PERFECTLY SAFE, is self-acting and very light, and will, in the item of rope alone, pay for itself in a short time.

The proprietors refer to the following mining companies, among others, that are now using this Safety Cage:—Gould & Curry, Savage, Ophir, Mexican, Empire, Overman and Justis.

For particulars and terms, apply to

HUGO HOCHHOLZER,

Virginia City, Nevada.

15v11tf Through Wells, Fargo & Co's Express.

Union Amalgamator.

This Valuable Invention

IS FAST FINDING ITS WAY INTO GENERAL USE, NOT by means of combination of capital and influence, but on the strength of its own merits, and upon the principle that what is known to be good will be appreciated. Practical men acknowledge the UNION PAN to be scientific, the best, the cheapest, and most profitable. It now stands first on the list of all pans in use for the purpose of

Working Gold and Silver Ores.

It has been found that a low class of ores, also tailings from Mills, Sulphurets, etc., that will not pay to work with the common pans, may be worked with this and obtain large profits. The UNION PAN is manufactured in two sizes, and capable of operating upon large quantities of ore in the most efficient manner.

Parties interested in Quartz Mining, Mills, etc., will find it to their advantage to call and examine for themselves, and see its operation.

Gold and silver ores tested by regular mill process, at moderate cost, by

STRONG & CO.,

San Francisco Foundry, corner Mission and Fremont streets, where orders will receive prompt attention.

15v12-3m

NEW MINING PUMP.

Excelsior Double-Acting Suction and Force Pump.

W. D. Hooker's Patent, August 15, 1865.

THE SUBSCRIBERS OFFER FOR SALE the following sizes of the above-named celebrated Pump, acknowledged to be the best Double Acting Pump known to be in use. They are more easily set in position, and are more durable and compact than any other Double Acting Force Pump; they are also worked with very little friction, and have greater forcing power than other pumps of like size. They are adapted to work by hand, wind-mill, horse, or steam-power.

No. 1—Cylinder 2¾ in., stroke 6 in.

VARNEY'S
PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setlers for themselves, at the **PACIFIC FOUNDRY,**

1v1 San Francisco.

BLAKE'S
QUARTZ BREAKER

Is now extensively used for breaking hard masses of

Quartz or Ores

To a size suitable for stamps. These machines are patented, and are in practical operation in

[Written for the Mining and Scientific Press.]

The Mineral Developments of Colusa County.

MESSRS EDITORS:—I have just returned from the oil region of Colusa county, where I find everything in quite a prosperous condition. The weather is fine, and the roads are again passable. The hills and plains are covered with verdure, and the air is odorous with the scent of beautiful wild flowers. The few enterprising gentlemen who have gone into that country to prospect for oil, seem to catch the life and vigor of spring, and all are busily engaged in applying or making preparation to apply the test, which will this summer determine, to a great extent, the existence or non-existence of oil in California. Most of the lands from the entrance of Lain's Cañon, from the plains on the east, to Wilbur Springs, a distance of 17 miles, is taken up and claimed for oil lands. There are "indications" to be found almost everywhere the whole distance; and in several places they are quite flattering.

Capt. Rowes' well is situated on Sulphur Creek, about half a mile to the east of Simmon's Sulphur Spring; it is about 150 feet deep, and has quite a showing of gas and oil. Operations were suspended on this well last winter, but I think the Captain intends to commence again this spring. About two miles below this, and a mile below the junction of Sulphur and Bear creeks, is the Emerson well. This well has reached a depth of more than 200 feet, through a large sandstone strata, and has had quite a flow of gas, with a flattering prospect for oil, all the way down. Mr. Hardinberg, the Superintendent, is erecting machinery with which to thoroughly test the well this summer. About two miles below the Emerson, on Bear Creek, is the Winum well, on which but little work has been done; but still the prospect is good. The Whiting well is located in Botts' Cañon, about a mile from its junction with Lain's Cañon. The company have a very fine steam engine, with all the necessary machinery for boring. They are pushing on the work, with bright hopes and a fair prospect for success. Mr. Hughes, of Sacramento, is busily engaged in getting up his machinery. I think he intends boring on Lain's ranch. The Shepardson well is situated in a gulch to the north, and about two miles from its junction with Lain's Cañon. This well has been sunk to a depth of about 130 feet. They are still at work, but are progressing very slowly. At the depth of 100 feet, a strata of soft, pebbly shale was struck, which caves in and fills up the hole as soon as the drill is withdrawn, It is estimated that sixty tons of this gravel has been taken out with the sand pump, since it was first struck The oil prospect is good, however, and if an experienced man could be found who could pass the tubing through this place, the well would promise fair for success. The Lewey well is located at the mouth of Lain's Cañon, about half a mile from the plains of the Sacramento Valley. This company has a very good location. The well is about 100 feet deep; but work has been suspended for some time. I don't know whether they will start up again this spring or not.

When I speak of these companies as having good prospects, I make a California comparison; as I know nothing of the Eastern oil fields, but what I have learned from books, or in conversation with those who have visited them. But from what I have learned, the indications here compare favorably with those of the East. There is oil and gas issuing from the earth in numerous places; there is also the sand, shale and limestone, and most all the other indications found in Pennsylvania. The only objection that can be raised is, that the strata is too much tilted, which objection I intend to speak of some other time. But, in addition to the oil interest, there is quite an interest in another direction.

About a quarter of a mile from Simmon's Spring (to the west), is situated the Oriental Quicksilver mine, upon which considerable work has been done this winter, resulting in developments that promise not only to add much to the mineral wealth of our State, but which have also brought to light much that is of interest to the scientific world. The company have a quicksilver lode from forty to sixty feet wide, intersected by various branches of sulphurets of mercury, containing free gold in considerable quantities. Here, then, we have a sulphuret of mercury and free gold, a combination that, so far as I can learn, never has

occurred before. [We should be pleased to add some specimens of this rare mineral to our cabinet.—Eds. Press.]

About a quarter of a mile to the north of the Oriental mine is the Burke sulphur bank, upon which Mr. B. has been at work for some time, and from which has been taken ont quite a quantity of native sulphur.

There are numerous other curious matters of geological and mineralogical interest ol which I would like to speak, but I fear my letter is already quite too long, and I defer anything further till nnother time. MINER.

April 25, 1866.

SECRET OF MAGIC.—Robert Houdon concludes his memories with a chapter of Arab miracles, which he explained. The Aissnoua eat powdered glass. Houdon powdered some for himself and ate it, and he avers that his appetite for dinner was improved by the same. They walk on red hot iron with bare feet, and pass their tongues over white-hot plates of iron. Prof. Sementrici discovered that by rubbing into the skin a solution of alum evaporated to a spongy state, it was rendered insensible to the action of red-hot iron. He rubbed himself with soap, and found that even the hair did not burn. He rubbed the alum into his tongue, and lapped the glowing metalic surface without pain. Houdon himself then tried passing his hands, slightly dampened, through a stream of melted iron, and found, as others have done, that it left no scar on him. An English conjurer used to thrust a sword through his body, shove a knife up either nostril to the handlo, and thus spitted, sing a song. Houdon bought the secret of the invulnerable, and now divulges it. The performer was very thin. With a waist-belt he strapped his tender paunch tight down upon the vertebral column, substituted a card-board stomach for the compressed part, covered all with flesh-colored tights; between the true and false abdomen he fastened a scabbard, covered the aperatures on the sides with rosettes, placed n sponge filled red liquid in the scabbard, and there thrust his sword, which came ont covered with bogus blood, of course. The pug-nosed mountebank enjoyed a physical conformation which permitted the delicate and frightful performance.

THE AMERICAN FLAG.—The facts as to the origin of the American Flag, are simply these: A number of flags had been used previous to the Declaration of Independence, none of which could he called *national*. On the 14th of June, 1777, Congress ordered "that the flag of the thirteen united States be thirteen stripes, alternate red and white; that the union be thirteen stars, white in a blue field, representing a new constellation." The idea is supposed to have been suggested by John Adams, who was then chairman of the board of war; and it is believed that he took the idea from the arms of the Washington family, the shield of which represents a white field traversed by two red bars, with three spur rowels or stars in the upper portion. The resolution of June 14th was not made public until September 3d, 1777, and the stars and stripes were first displayed conspicuously at the surrender of Burgoyne, in October of the same year. No attempt was made to alter the flag until 1794, when it was resolved by Congress that there should be fifteen stripes and fifteen stars in it. The addition of a star and a stripe for each new State was found to be exceedingly inconvenient, as it would soon enlarge the flag to ridiculous proportions. In 1817, Captain Reid, of the navy, who had commanded the famous privateer General Armstrong, suggested that the thirteen stripes be retained in commemoration of the thirteen original colonies, and that a new star be added to the cluster in the union on the Fourth of July next succeeding the admission of any new State. The suggestion was adopted by Congress, and on April 4, 1818, became a law. The first flag under this law was made by the wife of Captain Reid. This lady died in Baltimore, Md., nbont the year 1857.

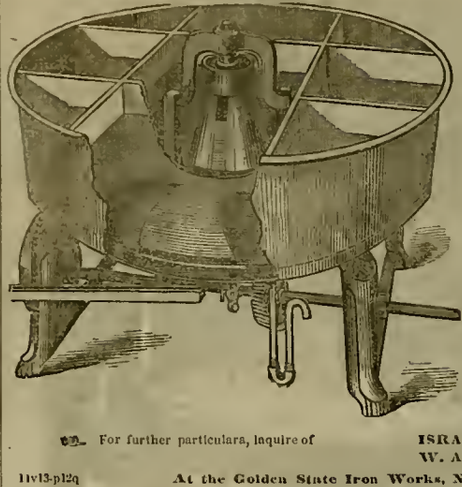
THE MYSTIC THREE.—Three forks to Jupiter's thunderbolt: three prongs to Neptune's trident; three heads to Cerberus; three legs to the tripod or stool on which the Pythian priestess vaticinated; three names to the sun—Sol, Apollo, Liberi; three also to the moon—Hecate, Diana and Luna; three ablutions at sacrifices; three bows on approaching royalty; once, twice, thrice, and away, say the boys; and three balls are the ominous emblem of pawnbrokers.

THE MEMORY OF A MOTHER.—When temptation appears, and we are almost persuaded to do wrong, how often a mother's word of warning will call to mind vows that are rarely broken. Yes, the memory of a mother has saved many a poor wretch from going astray. Tall grass may be growing over the hallowed spot where all her earthly remains repose; the dying leaves of autumn may be whirled over it, or the white mantle of winter may cover it from sight; yet the spirit of her, when he walks in the right path, appears, and gently, softly, mournfully calls to him when wandering off into the ways of error.

We must pass through this world to unlock the mysteries of the next; and it is only in the next that we can find a key to unlock the mysteries of this.

Knox's Improved Patent Amalgamator and Separator,

With Palmer's Patent Steam Chamber or Die.



THIS CUT REPRESENTS AN AMALgamator and Separator that has stood the test of EIGHT YEARS' practical working in the gold mines of California, and for nearly the same time in the silver mines of Nevada, having been introduced into the first steam mills built in the then Territory, since which time they have been successfully working against all competition.

The great advantages these Amalgamators have over any others, are—

1st. **Much less Cost.**

2d. They do not "flour" the mercury, and collect any that may have been "sickened" in the battery or grinders.

3d. The "sloshing" motion given to the pulp (by the revolution of the muller under the stationary frame) against the amalgamated copper plates that are fastened to the frame, and by this means catching the fine gold and mercury that will not settle.

4th. The gate in the cone, through which the pulp is discharged, from the top, and where there is the least motion, almost precluding the possibility of any granulated mercury or fine gold escaping.

There are over 500 of them in use in California and Nevada, where those interested can see their practical workings.

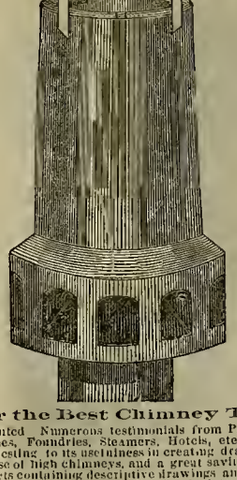
A RARE CHANCE FOR INVESTMENT,

THE PATENT RIGHT FOR SALE FOR STATES, TOWNS AND COUNTIES.



For the Best Chimney Top

Ever invented. Numerous testimonials from Proprietors of Factories, Foundries, Steamers, Hotels, etc., can be shown, attesting to its neatness in creating draft, saving the expense of high chimneys, and a great saving of fuel.

Pamphlets containing descriptive drawings and testimonials will be sent free, upon application by letter or otherwise to the patentee, B. A. HENRIKSEN,
Or J. E. JOERGENSEN,
12v12-3m No. 328 Kearny street, San Francisco.

Portable Steam Engines!

"Hoadley's" and "Hittinger's" Make,

COMBINING THE MAXIMUM OF EFFICIENCY, Durability, and Economy, with the Minimum of weight and Price.

These Engines are favorably known, a large number being in use on this coast for hoisting, pumping, threshing, milling and mining purposes.

Steam can be got up on these Engines in fifteen minutes after reaching the place of operation, and the time, expense of setting boilers, machinery, and "construction account" saved, (which is often the difference between the successful and unsuccessful prosecution of milling enterprises,) in fact, the portable principle is the pioneer's friend, and enables him to draw engines on their own wheels to his cabin door, and plant on the outermost confines of civilization the saw and grist mill, and it has done and will do more to help subdue the continent than any other of the modern motors which are crowding society and normalizing the world.

All sizes on hand from 3 to 30 horse power, with and without carriages.

Also, Portable Saw and Grist Mill's.

For sale by TREADWELL & CO.,
3v12-3m Corner of Front and Market streets.

THE PRESS is a large, sixteen page paper, and is truly a valuable assistant to the mining interests of the Pacific Coast.—Nye County News.

BAUX & GUIOD S

Separator & Amalgamator

Is the most important improvement in mining machinery ever introduced. It was awarded the FIRST PREMIUM at the San Francisco Mechanics' Fair for 1864, where it proved itself to be the best Separator and Amalgamator among all the competitors. Constructed on principles which combine SCIENTIFIC KNOWLEDGE WITH PRACTICAL EXPERIENCE, these Pans extract more gold and silver from their ores than any others in use, as a few hours trial will demonstrate. Mill men will find it to their advantage to employ these pans as Separators, in addition to the ordinary Amalgators now in use, and to re-work their old tailings.

The cost of these pans is inconsiderable, and their structure is such that they can be readily separated in parts convenient for packing on mules. Among the many advantages possessed by BAUX & GUIOD'S Pan, are the following: The trifling cost for attendance; Its small cost; Its portability; The large quantity of pulp it can operate upon in a given time; It may be worked even weeks without stopping as it is constructed to work continuously; The complete thoroughness of the separation of the rock from the metals and the trifling power required to work them; They can be attached to any ordinary crushing apparatus.

We have the pleasure of referring parties interested to the following parties, who have our Pan in use: Jeffersonian Mining Company, Bowman's Ranch, Nevada county; The French Mill, Nevada City; Crall's Gravel Cement Works, Nevada county; Waltman's Chlorination Works, Nevada, Cal.; Gold Hill Quartz Mill, Washoe.

Manufactured at the Vulcan Iron Works and San Francisco Foundry, San Francisco, and at Heugh & Thom's Foundry, Nevada City.

For further particulars, or to see this Pan in operation, call on or address J. B. BAUX,
Fremont Street, near Mission, adjoining the San Francisco Iron Works, San Francisco. 4v8-6df

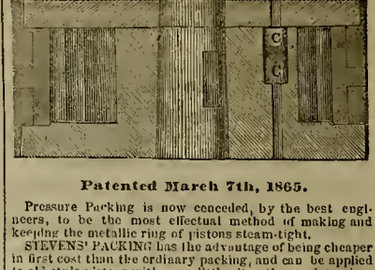
San Francisco.

Leffel's Lever Jacks,

For railroads, cars, or wagons; Railroad Jacks for engines and cars; Track Jacks for leveling, with which three men, with a pair of these Jacks, can level more track in a day than twelve men working in the ordinary manner; also, Track Jacks, for relieving the axle of pressure to replace the brass. These Jacks are now in general use in the Eastern States, and give entire satisfaction. Also, Wagon and Track Jacks of the most superior make and kind. For sale by KNAPP & GRANT,
12v12-3m San Francisco,

Stevens' Pressure Packing.



Patented March 7th, 1865.

Pressure Packing is now conceded, by the best engineers, to be the most effectual method of making and keeping the metallic ring of pistons steam-tight.

STEVENS' PACKING has the advantage of being cheaper in first cost than the ordinary packing, and can be applied to old style pistons with very little alteration or detention. In place of testimonials, the Patentee requests of those who are using the old spring packing to inquire of the owners of the various engines which now have this packing in use—some of which have been running from three to twelve months without being opened, or showing any descriptive leak—and act upon their recommendation.

Further particulars can be had by applying to the Patentee, ANDREW STEVENS, Master Mechanic, Alameda Railroad, or at the VULCAN IRON WORKS, where they can be seen, at any time, in course of construction.

10df ANDREW STEVENS.

PETROLEUM STOVES.

A **MOST USEFUL INVENTION FOR ALL** manner of COOKING and for IRONING, without any filter, as ashes or soot. Cheap and convenient, and peculiarly suited to the wants of this community.

Cooking by them is divested of its disagreeableness, and becomes a pastime, as many can testify, who have used them in this city. To be seen at

316 Montgomery street,

Where they are for sale by

BULLARD & BATTLES,
Proprietors for California.

SAVE YOUR MONEY AND BUY,

For $100!

HUNTER'S
Premium Concentrator!!

Awarded a Silver Medal at the Mechanics' Fair of 1865.

THE ABOVE MACHINE HAS BEEN RECENTLY IMproved and simplified, doing away with all complication and friction, thereby requiring less power and speed. As improved, 125 revolutions per minute is the regular speed required, but any speed varying from 100 to 135 revolutions does not change the results. It is the only machine built on the Pacific coast that is perfectly adjustable for all the different grades of ores, and will save ten per cent. more sulphurets than any Concentrator in use, and is the cheapest, from the following list of prices:

For a single machine of the capacity of five tons in twenty-four hours, as it passes from the battery or pans, $125. For double machines of two, three, or four tables in one frame, each table of five tons capacity, $100.

I have been running machines for the past three months at Grass Valley, therefore I make my assertions from a practical working test, where several of the machines are working. Persons desirous of seeing the machines running, can do so at Empire Mill, Grass Valley, where twelve machines can be seen in operation, or in San Francisco, at 118 Washington street, below Davis, where ALBERT JACOBS will fill their orders promptly.

ANDREW HUNTER,
17v12-tf Inventor.

The Great Pain Annihilator.

DR. E. R. JOHNSON WILL WARRANT TO CURE ALL cases of Asthma, Fever and Ague, Catarrh, Sore Throat, and Womb Diseases. The doctor's success is miraculous in cases of RHEUMATISM, NEURALGIA, CONSUMPTION, GOUT, PARALYSIS, INFLAMMATION OF THE EYES, and all other diseases that human skill can reach. Rheumatic Pains removed in five minutes. Some of the afflicted that visit him come from one to six hundred miles, and soon find relief. Persons at a distance can be cured at home by addressing a letter to Dr. Johnson, No. 700 Market Street, San Francisco, stating case, symptoms, length of time the disease has continued, and have medicine promptly forwarded to any part of the country, with full and plain directions. ☞Consultation by letter or otherwise, FREE. 16v12-1m

---

BY EXPRESS.—Two cents per copy will be added to our usual rates of subscription (to pay Wells, Fargo & Co.'s tariff) on papers sent by express. If connecting expresses in the interior make additional charges, subscribers must themselves settle the same.

INGENIOUS METHOD.—The ordinary methods of crushing large masses of cast iroo into fragments are both cumbersome and expensive, but by the means which has lately been described in *Les Mondes*, this operation may be conducted with considerable easé. The new French method consists io drilling a hole in the mass of cast iron for abont one-third of its thickness, filling this with water, closing it with a steel plug which fits accurately, and letting the ram of a pile-driver fall on the plug. The very first blow splits up the mass.

IT is said that 279,000 gallons of wioe, worth more than five hundred thousand dollars, was made during the past season on the south shore of Lake Erie.

TRACES of lithium, rubidum, titanium, and vanadium, as well as of copper, lead and tin, have been discovered in basaltic rocks at Giesseo, near the Hartz Mountains.

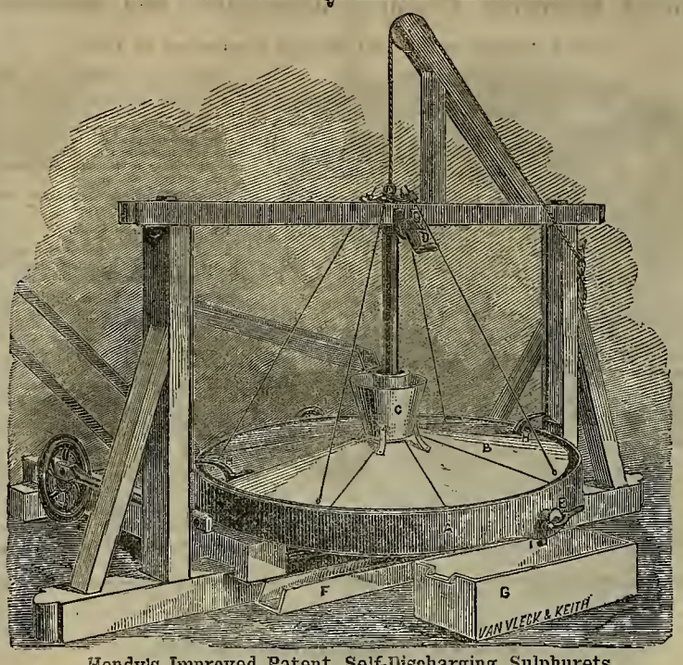
NOTICE TO QUARTZ MINERS.



Hendy's Improved Patent Self-Discharging Sulphurets
PRATER CONCENTRATOR
Is Receiving Universal Favor.
Reference is made to the following Mills which are using the Prater Concentrator, with some of the improvements attached. The Self-Discharging Sulphurets has been more recently adapted, and the public attention is called to examine its workings:
STEPHENS' MILL, Humboldt County, Nevada.
CHRYSOPOLIS MILL, " " "
U. S. REESE RIVER MILL, Austin, "
UNION MILL, El Dorado County, near Mud Springs.
NEW YORK AND EL DORADO CO., " "
CONEY MILL, Jackson, Amador County.
Messrs. TUBBS & CO'S MILL, San Andreas, Amador Co.
WINTER'S MILL, Angels Camp, Calaveras County.
CLIO MILL, Jacksonville, Tuolumne County.
CARROL & ASPINWALL MILL, Reese River, Nevada.
And in use in other parts of this State; also in Idaho, Arizona, Colorado and Mexico.
As a further evidence of its worth, orders have been received recently from the proprietors of the following mills, all of whom are using these Concentrators, or have works in the immediate neighborhood of mills using them, viz.:
One Concentrator ordered for the Coney Mill, Jackson, Amador County, by Messrs. Bigelow & Bro., of this city.
Three Concentrators for the Spring Hill Mill, Volcano, Amador County.
Two Concentrators for the Golden Gate Mill, Volcano, Amador County.
Four Concentrators for the Raw Hide Ranch Mill, Sonora, Tuolumne County,
Six Concentrators for the Benton Mill, Bear Valley, Mariposa Co; ordered by Messrs Dodge & Bro, San Francisco.
They may be seen in operation at the GOLDEN STATE FOUNDRY, No. 19 First Street, San Francisco.
☞For explanation of the above engraving, and other particulars, send for a Circular
JOSHUA HENDY,
8v12tf No. 402 Montgomery street, Room 3, 4th floor.

HEPBURN & PETERSON'S PANS AND SEPARATORS.
For Reducing and Amalgamating Gold and Silver Ores.

We invite the Mining Public to examine the record of our Machines before adopting any other for producing similar results. They have been in general use for the past three years, during which time they have been repeatedly tried in comparison with every other machine of note, and of a similar nature, and have invariably been adopted in preference; which facts we offer as the most suitable recommendation, and which is attested by the following list of
Principal Mills Using them:

New Mining and Other Advertisements, etc.

Gold in San Mateo County.—The San Mateo *Gazette* of May 5th, has the following:

"We have been shown some very rich specimens of gold-bearing quartz, that was taken from a ledge not four miles from Redwood City. The same party who discovered this ledge, also has two or three pennyweights of fine gold, that he panned out by moonlight the other evening, from dirt taken out of a mine in the vicinity of the quartz ledge. We are not at liberty to make any more definite statements, as to either the location or the person making the discovery. His operations so far have been carried on in the night to avoid discovery."

It will be noticed that this panning out was done by "moonshine."

A Gold Placer in Ohio.—We have been permitted to make the following extract from a letter received by Prof. Rowlandson, of this city, per last steamer, from Prof. Chas. S. Richardson, of New York:

"A great gold placer has been found on the lake shore in Ohio. Some gentlemen here have just returned from there, and have brought with them quite a nice little lot of gold. It is all in thin flakes. They say it lies from two to four feet deep in the gravel, and upon a hard bed of clay. The specimens of gravel they brought is a drift, very much broken, with black, blue and yellow quartz, together with some gneiss and pieces of what appears to be trap and greenstone. A liberal offer was made me to go out and examine the discovery, and report upon it; but I have too much on my hands to undertake the trip."

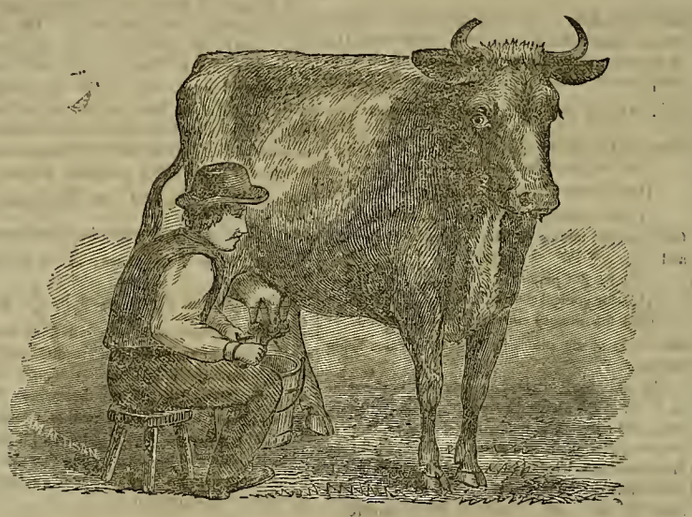
New Crusher and Pulverizer.—Mr. Joseph Fowler, of Rahway, N. Y., has recently invented, and patented in this and several European countries, a crusher, something similar to the Blake machine, and a pulverizer, upon what appears to be quite a new construction. A model of this crusher has been placed on our table for the examination of such as may be interested in such matters; together with a rough sketch and description of the pulverizer. A letter from the inventor states that quite a number of the machines have been sold in Europe. No effort has yet been made to introduce them to the California public. The chief merit of the invention appears to be in the pulverizer, which it is difficult to describe without drawings. Persons interested can examine the sketch and accompanying description left with us at the office of the Mining and Scientific Press.

New-York Experts.—We refer with pleasure to the professional card of Messrs. Maynard & Tiemann. We like the manner in which these gentlemen transact their business with publishers. It is an indication of promptness and accuracy in all their transactions.

THE AMERICAN COW MILKER.

We present herewith a very fine illustration of what is known as "The American Cow Milker," together with the manner of using the same. This machine is exceedingly simple in its construction, easily worked, cheap and effective. In evidence of this assertion we have the unqualified and voluntary testimonials of several of the most influential agricultural journals published in the Atlantic States.

In no part of the world is a machine of this description so much needed as in California, where labor is high, and where there is also such a disposition to slight almost every description of work. The losses incurred by dairymen in this State, from the hurried and imperfect manner in which milking is done, is



very large, both in the loss of the most valuable portion of the milk itself, and in the early drying up of cows. The large amount of labor now required in milking, induces many dairymen to purposely dry up their cows whenever butter gets down to forty or fifty cents per pound, which abuse would hardly be indulged

Fig. 2

in were a machine in use which would accomplish what is claimed for this invention.

The idea of milking the four teats of a cow at once with some suitable machine of simple construction, is one of the new ideas of this progressive age.

We commend to the careful attention of our agricultural friends in particular the following description of this novel and useful machine, which we copy from the New York *Artisan* of January 24th:

Figure 1 in the above engravings represents a cow-milker in operation, and Fig. 2 an enlarged view of the same. This is the invention of L. O. Colvin, of Marathon, N. Y., who has given this subject much attention, and whose father was a dairyman of great experience. His machine to all appearances is a complete success; it certainly is a mechanical triumph. Why should we not milk cows profitably with a machine as well as mow the grass, reap the grain, or stitch the cloth? Once those things were looked upon as questionable, but now they are established facts; and certainly it requires no great stretch of imagination to predict an equal triumph for the "American Cow-milker." This machine is very simple in its construction, and consists of a light iron casting which forms the body of the machine (see Fig. 2), to which is attached four rubber teat-cups to receive the four teats of the cow. The working of a small rubber diaphragm under each teat-cup produces a sudden strong remitting suction like a calf, which draws the milk and passes it into the center receiver and so out through the spout into the pail. The diaphragms are worked by one lever and the machine is held in position by the other.

The operator sits up to the cow as usual, applies the machine, works the handle back and forth, and like four calves he milks the cow; like them, also, the machine draws and stops drawing, to swallow. Since each teat-cup acts independently of the other, the three-teated cows are milked as well as any, and when cows give more milk out of some teats than others that fact does not interfere with the working of the machine or "finishing" the cow. This apparatus is readily applied to any cow (being self adjusting), and it is as easily detached. The instant the machine is not worked, it can be taken off; and while it is being applied it sustains itself, and the operator has only to work the handle. Being so natural in its application, the cows like to be milked by it; and three minutes, it is said, are sufficient to milk any cow. This cow-milker is quickly washed by pumping water through it—first cold water to rinse off the milk and then hot water to scald it, after which it is easily taken apart and set away to dry. The metal part is japanned black, the rubber work is of usual color, making a cow-milker of very neat appearance. It is small, convenient, and durable, and doubtless will receive a hearty welcome at the hands of every country-gentleman, farmer, and dairyman.

Letters Patent for this machine were secured on March 28, 1865. For further particulars address L. O Colvin, 335 Broadway, New York.

No man's character is so black but that it may be cleansed by gold, if only enough of the metal be used.

THE OPHIRVILLE, PLACER COUNTY, MINES.

Private advices from Ophirville, a point about three miles below Auburn, Placer County, speak very encouragingly of the mining prospects of that locality. Quartz mining operations there, until quite recently, have been carried on very loosely. Some time last fall several experienced miners went in there, became satisfied with regard to the value of the mines, commenced operations on a more liberal and scientific basis, and the result has been most satisfactory to all parties concerned. We gave quite a full notice of these mines in our issue of the 13th of January last. They consist of a series of fourteen east and west lodes, crossed at right angles by six others, running north and south, all varying from two to four feet in thickness, and located from one to five hundred feet apart. Two of the east and west veins carry silver, specimens from one of which, taken from the surface, are said to assay $125 per ton. Two others carry copper, showing carbonates and oxides strong, on the surface, with sulphurets coming in gradually at fifty feet in depth.

A company, known as the Ophir Tunnel Company, is now running a tunnel to cut all those veins in succession, which will be accomplished within the distance of 4,500 feet, the company to have a certain extent on both sides of their tunnel, upon each vein cut, for draining the same. Three or four mills are already in operation in this vicinity. We have a letter before us, dated at Ophirville on the 9th instant, which says, in substance, that two Danes have been digging on a small vein of quartz near the Scraggy Point Copper shaft (on one of the copper veins of the series), and upon the line of the tunnel. They had already taken out about $3,000, having pounded out $1,000 last Saturday, from 25 lbs. of quartz. The lode they were on was but two or three inches wide, and lay between slate and granite—the hanging wall of the lead being the copper croppings. The party was down about twenty feet deep. They kept their success private as long as they could; but the Tunnel Company, on whose ground they were working, drove them off as soon as they learned what they were doing.

One of the best of the lodes referred to is known as the Peter Walter Lode, some very fine specimens from which, showing large quantities of free gold, have been submitted to our inspection. The sulphurets from this mine are said to assay as high as $1,180 per ton. We understand that the tunnel property, with its twenty lodes of gold, silver, and copper, has been secured by a party of San Francisco capitalists; also the Peter Walter lead, which is a separate interest. Both of these properties will be placed in the New York market.

Crowded Out.—We have quite a number of notes in our note book, which are necessarily laid over until another week; some of which were gathered during our late trip to the mountains.

Among the great tunnels of the world is that which connects Camagli with St. Marguerite, on the road between Genoa and Chivari. It is 3,500 yards in length, and is just completed.

Communications.

In this Department we invite the free discussion of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

THE TRACTORY CURVE, AND THE PROPERTIES OF GRINDING PLATES.

NUMBER II.

BY W. A. GOODYEAR,
Civil and Mining Engineer.

I thank Mr. Randall for the compliments he has been pleased to bestow upon me, and which form so large a part of his recent witty and classic reply to my first article upon the tractory curve and the properties of grinding plates; but as neither my own scientific aequirements, nor those of the author of the Quartz Operator's Hand Book, constitute precisely the question which I had proposed to discuss, he will perhaps excuse me for leaving this portion of his article unanswered.

I will now first acknowledge and correct two errors into which I have fallen, and for which my only excuse is the fact that my former article was rapidly written last January, and that since that date I have not looked at the subject farther than simply to correct the "proof" for the printer, till my attention was again called to it by Mr. Randall's recent article.

These errors occur in that portion of my article relating to conical and curved grinding surfaces, and vitiate, of course, in certain respects the results which I obtained for such.

The first consists in decomposing, as I have done on page 162, the vertical pressure at any point of curved plates into two components, one of which is normal to the surface, and the other *parallel to the tangent of the meridian curve*. This force should be so decomposed that one of the components is normal to the surface, while the other one, lying in the plane of the meridian curve, is *horizontal*, *i. e.*, perpendicular to the axis. This horizontal component is then met and neutralized by an equal and opposite force coming from the opposite side of the axis, where a similar decomposition takes place. The second error consists in tacitly assuming that the vertical pressure per unit of superficial area, upon any portion of the curved surface, is equal to the vertical pressure per unit of area measured upon the projection of that surface on a horizontal plane, *i. e.*, on a plane perpendicular to the axis.

Having stated these errors, I will now give general formulas in which they are corrected, and which will be found to yield correct results.

Let a' represent the angle included between the axis, and the tangent to the meridian curve at the point x, y. Let P, as in my first article, represent the vertical pressure per unit of horizontal area at the circumference of the plates. Let P′ represent the vertical pressure per unit of horizontal area at the point x, y. Let P″ represent the vertical pressure per unit of superficial area at the point x, y. Let P‴ represent the normal pressure per unit of superficial area at the same point. Let s represent, as before, the length of any portion of the meridian curve. Let a represent the exterior radius of the plates, and let f represent the co-efficient of friction. The following relations then exist between these quantities:

(1) $\sin. a' = \frac{dy}{ds}$.

(2) $\text{cosec. } a' = \frac{ds}{dy}$.

(3) $P'' = P' \frac{dy}{ds}$.

(4) $P''' = P'' \frac{ds}{dy} = P'$.

(5) P = the value which P′ assumes when $y = a$.

For surfaces whose exterior radius is n, the following formulas are then general:

(6) Total vertical pressure,

$$= \int 2\pi P'' y \frac{ds}{dy} dy = \int 2\pi P' y \, dy.$$

(7) Total normal pressure,

$$= \int 2\pi P' y \frac{ds}{dy} dy.$$

(8) Total force of friction,

$$= \int 2\pi f P' y \frac{ds}{dy} dy.$$

(9) Moment of friction,

$$= \int 2\pi f P' y^2 \frac{ds}{dy} dy.$$

(10) Mechanical effect of friction in a single revolution,

$$= \int 4\pi^2 f P' y^2 \frac{ds}{dy} dy.$$

(11) Total grinding effect in a single revolution,

$$= \int 4\pi^2 P' y^2 \frac{ds}{dy} dy.$$

For complete or entire surfaces, the limits between which these integrals must be taken, are 0 and a, and for ring surfaces, the inner radius and the outer radius.

In what follows I shall assume that P is known, and is the same in all cases.

Now, when I use the phrase "vertical wear," I mean by it the thickness measured in a vertical direction of the layer of material worn from the plates by a given amount of motion, and I still maintain, and for the same reasons as in my first article, that uniformity of *vertical wear* is a condition that does not depend upon the particular *form* of the grinding surface, but is one of the necessary conditions of grinding with *solid* plates of *any* form. If this be admitted (and it seems so simple as to be almost an axiom), it follows at once that with flat plates of uniform hardness, P′ must vary inversely as y, and that in order that P′ may be constant, the hardness of the plates must vary as y, and in this article I shall assume that the same law holds for curved surfaces.

Weishach, now, expressly states that he assumes the vertical pressure to be equally distributed. The cases then which he considers are those in which the hardness varies as y. For these cases P′ is constant and equals P, and with this value of P′ it will be found that formulas (6), (9), and (10), as given above, agree with all of his results. The relative grinding effects, then, for a single revolution with entire plates, whose hardness varies as the ordinate, are as follows:

(12) for flat plates..... ,6667
(13) for conical plates..... ,7453
(14) for tractory conoidal plates..1,0000

the hight of the cone in (13) being $h = \frac{n}{2}$, and the weight of the plates being the same in all three cases. These results are given by formula (11). If, on the other hand, the plate be of uniform hardness, then P′ varies inversely as y, and is equal to $P\frac{a}{y}$. Taking this value of P′, we obtain from formula (11) the grinding effect in one revolution:

(15) for flat plates.....$2\pi^2 Pn^3$.
(16) for conical plates...$2\pi^2 Pa\sqrt{a^2+h^2}$.
(17) for tractory conoidal plates.$4\pi^2 Pa^3$.

Or, *relatively*, taking as I have done in (12), (13), and (14), $2\pi^2 Pa^3$ as the unit,

(18) for flat plates.....1,000
(19) for conical plates.....1,118
(20) for tractory conoidal plates...2,000

the weight of the plates in these three cases being the same.

The pressure P *at the circumference* is the same in all six of the above cases; but in the last three, where the hardness is uniform, the *total* pressure or weight of the plates is *twice* as great as it is in the first three cases where the hardness varies as y. If we assume the weight of the plates to be the same in all six cases, the pressure at the circumference will be only half as great in the last three cases as in the first, and the ratio of grinding effect will stand as follows:

For plates whose hardness varies as y—
(21) flat plates..... ,6667
(22) conical plates..... ,7453
(23) tractory conoidal plates....1,0000
For plates of uniform hardness—
(24) flat plates..... ,5000
(25) conical plates..... ,5590
(26) tractory conoidal plates.....1,0000

For ring plates whose outer radius is n, and whose inner radius is $\frac{a}{3}$, and *whose total weight is the same as that of the entire plates just considered*, these ratios will stand:

For plates whose hardness varies as y—
(27) flat plates..... ,7222
(28) conical plates..... ,8075
(29) tractory conoidal plates.....1,0000
For plates of uniform hardness—
(30) flat plates..... ,6667
(31) conical plates..... ,7453
(32) tractory conoidal plates.....1,0000

and for—
(33) Randall's Patent Grinding Plates..... ,7500

In my first article (page 210) I gave certain ratios for the grinding effect of ring plates, supposing the vertical pressure at the circumference to be the same in all cases, the total weights of the plates being different of course. Those ratios for the flat plates were correct under that supposition, though, as I have already stated, they were incorrect for the conical and tractory conoidal plates. The result there stated for Randall's Plates is also incorrect, for the following reason: In the calculation by which I obtained it on page 178, I committed one of Mr. Randall's "school-boy errors," in assuming that the pressure at any point of the surface of the inner ring was equal to the pressure at its outer circumference, multiplied by $\frac{a}{y}$. The former is, in fact, equal to the latter multiplied by $\frac{2a}{3y}$, and with this correction, the result which I gave as 1,4444, will be found to be 1,3333. The corrections for the other cases are simple, and are given directly by formula (11). I have now explained and corrected my errors.

Mr. Randall complains that in my first article I did not tell the whole truth, inasmuch as I did not state comparative results for plates of *equal weight*, instead of for plates having equal vertical pressures at the circumference. I have now, therefore, conformed myself to his standard in this respect, and the results in this article from (21) to (33) inclusive, are for plates whose total weight is in all cases the same, viz., $n\,Pn^2$. The vertical pressures per unit of horizontal area at the circumference, in these cases, are as follows:

For (21), (22) and (23).....P.
For (24), (25) and (26).....$\frac{1}{2}$ P.
For (27), (28) and (29).....$\frac{9}{8}$ P.
For (30), (31) and (32).....$\frac{3}{4}$ P.
For (33).....$\frac{9}{8}$ P.

By comparing the above results with Mr. Randall's recapitulation, on page 260, it will be seen that we now agree with reference, first, to the mutual ratios for entire plates of equal weight *among themselves*, and second, to the mutual ratios for ring plates of equal weight *among themselves*, but that we still disagree as to the ratio between entire plates and ring plates of the same weight. The reason of this is that in Mr. Randall's discussion, whether he knows it or not, he has *not* taken the conditions such that the *total weight* of his ring plates is the same as that of his entire plates; but he has taken his ring plates such that their total weight is equal to the weight of that portion of his entire plates which would be left if a circular portion whose radius is $\frac{a}{3}$ were removed from their center. The total weight of his ring plates is, therefore, equal to $\frac{8}{9}$ of that of his entire plates; and if his numbers for ring plates be all multiplied by $\frac{9}{8}$, the corresponding plates will then all have the same weight, and our numerical results will agree throughout.

I had supposed that in my first article I had at least made my *meaning* so clear that a mathematician could not well misunderstand it; but I find that Mr. Randall has done so, and there are in his article some flagrant misrepresentations that I cannot allow to pass unnoticed.

In speaking of the secondary curve which I discussed, he says: "Mr. Goodyear errs in premising that the wear to the plates *takes place*" (the italics are mine) "in the direction of the normal reckoned from the point of tangency." I premised no such thing. By referring to page 162, he will see that I use the words, "where this wear *would* actually take place, *if it could take place at all*," and the whole tenor of my article went to show that *such* a wear could *not* take place at all. I discussed the secondary curve, because I thought it involved in the proposition on page 103 of the Hand Book. If I have misunderstood the author upon this point, I regret it; but I submit that the man of straw was not entirely of my own creating, and that the proposition referred to, if it means anything *as there stated*, may justly be taken to involve the idea of this very wear which cannot take place, and, consequently, of the secondary curve which I discussed.

Again, on page 259, Mr. Randall says "$n\,Pa^2$ is the volume or size of the plate which Mr. Goodyear tells the public has for its grinding effect $2\pi^2 Pn^3$." I did not tell them this; but I told them (and the statement is true) that, with circular plates of equal radius, and having equal vertical pressures (P) at *the circumference*, the grinding effect of plates, whose hardness is uniform, is $2\pi^2 Pa^3$, while if the hardness vary as y, it is $\frac{4}{3}\pi^2 Pa^3$. I distinctly stated, too, (and Mr. Randall has quoted the statement, with an accompanying question that seems to me absurd, considering the clearness with which I stated the standard of comparison which I was using,) that in these two cases the *total* pressure or weight (corresponding to what Mr. Randall here calls the "volume") was greater in the one case than in the other. It is, in fact, twice as great.

Also, on page 260, Mr. Randall says: "Mr. Goodyear would show by his (figures) that a plane plate of uniform hardness will grind fifty per cent. more than a plate of the same size and *weight*" (the italics are mine) "and hardness at the circumference, and which decreases in hardness toward the center in the ratio of the decrease of the radius." This is not what I said or attempted to show. It would not be true. What I did say will be apparent by referring to my article, and I was right upon this point.

On the same page he says: "He tells us that the entire plate of any of the forms considered will grind more than the corresponding ring plate of the proportions given, which I have proven by the authorities and demonstration to be a misstatement. He tells us that the plane plate of uniform hardness will grind more than Randall's Patent Grinding Plates, which statement is doubly refuted." Two more misrepresentations of the same kind! I made no such statements for plates of equal weight. I made them only for plates having equal pressures at the circumference, and for such plates both statements are true. My comparisons throughout that article were for equal *pressures at the circumference*, and *not* for equal weights of the plates, and I said so then.

Mr. Randall's solution of the problem of plane and conical grinding plates, on page 260, if I understand it, tacitly admits the principle of the *distribution of pressure* which I have enunciated; for otherwise, his proportion, "S : V :: E : G" could not hold true for solid plates.

He is approaching the truth. He has already corrected various errors in the Hand Book relating to ring formed plates; and when in his calculations and statements of comparative results he makes his ring plates really of the same weight as his entire plates, he will be nearer right than he has been yet.

If it would not be saying too much, however, I would suggest that his demonstrations would be as clear and no less elegant if he would not confound *volume* with *pressure*. The volume of a solid of uniform density is, of course, proportional to its weight and to the total pressure produced by that weight; still, when dealing in fact with pressure instead of volume, it is just as easy to *say* "pressure," and in some cases it is less likely to lead to indistinct and, possibly, erroneous ideas. His misunderstandings and misrepresentations of my clearly-expressed meaning evidently arose, with one exception, solely from his confusion of the ideas of volume and pressure.

It will be seen from what proceeds that I now admit that differently-formed plates of equal radii, hardness, and weight produce very different amounts of grinding effect in a single revolution. The tractory conoid, however, by no means gives a maximum of grinding effect under these conditions. The expression for the grinding effect of the cone is a function of h, the hight of the cone, and by increasing h, we can increase without limit the theoretical grinding effect, while still preserving the *same weight*, etc., of the plate.

But there is another point upon which I must say a few words, though Mr. Randall does not wish it "logged into" the question, and that is *power* or *mechanical effect*.

The point which I had proposed to discuss was *not* simply the relative *amount* of grinding effect produced by plates of different forms. It was the broader question of the *relative advantages* in the grinding effect to be derived from differently-formed grinding surfaces, and into this question the element of power *necessarily* enters.

It will be seen that formula (10), which gives the mechanical effect or power consumed by the friction in a single revolution, and formula (11), which gives the grinding effect, are identical, with the exception of the coefficient of friction f, which is constant, and as these formulas are general, the law is also general, whatever be the form of the grinding surface, that the mechanical effect or power expended is *directly proportional* to the grinding effect produced.

Mr. Randall, on page 260, after first objecting to any consideration of the element of power, says: "No mention in that work (the Hand Book) is made of *power* in *connection* with *grinding effect*. It requires no demonstration to prove that it takes more *power* to reduce *ten tons* of rock than it does to reduce *one* to the same degree of fineness from the same condition at first. Any school-boy can tell us that, saying nothing of practiced miners and mechanics. What was claimed, and is claimed, and is true, is that the tractory formed pan will do very much more work than either the flat or conical pan of the same weight, and I will now add do the same amount of work at a less expense of *power*."

The Hand Book, indeed, makes no mention of power, and, *therefore*, (in addition to its other errors,) the whole character of its dis-

cession of grinding plates is calculated to lead the reader to infer that no more power is required for a single revolution with one plate than with another of the same weight and size, but which produces a different grinding effect, and hence that the advantages of differently formed plates are in the precise ratio of their grinding effects, and his reply to my article points in the same direction. If this be not a "fallacy," it is something worse—an absurdity; and if this be not the idea that the author of the Hand Book *intended* to convey, then, in honesty, he should have said so, and not have led his readers to think the contrary, by claiming increased grinding effect as an advantage *irrespective of the question of power*.

Mr. Randall may hereafter think that "any school-boy" could have told us so simple a fact in mechanics as that the amount of power expended is always equal to the total amount of effect produced if measured by the same unit, and that these two quantities are always directly proportional to each other if measured by different units. If he makes this statement, I shall hardly question its truth; but I beg that he will not couple it with a reassertion of the flat contradiction that the tractory conoidal pan "*will do the same amount of work at a less expense of power*" than other pans. No form of grinding surface will enable us to accomplish this.

I start with the premise that no peculiar advantage is gained in simply increasing the grinding effect, if the power expended to produce it must be increased *in precisely the same ratio*, and, therefore, I still deny *in toto* the *advantage* which I understand to be claimed for the tractory conoid as a grinding surface. Mr. Randall may have only *intended* to claim at first that the tractory conoidal grinder of the same size and weight *would produce a greater effect in a single revolution* than the other forms considered; but his silence in the Hand Book on the question of power; his reluctance to have this question introduced, and still more, his assertion that this pan "will do the same amount of work at a less expense of *power*," show that now, at least, he claims something more, and that on this point I am not combating a "man of straw."

The tractory conoid does produce a greater effect in a single revolution than the other forms above considered; but it does not produce so great an effect as the cone of the same weight and base will do if h be increased beyond $3a$. Neither these nor any other forms produce an increased grinding effect, except at the expense of a precisely proportional amount of power, and we can obtain *this same* result with any form by increasing the weight or size of the plates.

It will now be evident, I think, both from what I have said and from Mr. Randall's own admissions, that the Hand Book contained in principle as well as in detail sufficient errors and "fallacies" to justly subject it to criticisms as severe as any that I have made.

The errors into which I fell myself, though they affected my numerical results, *did not* affect the *main* and *important* points upon which I insisted, and upon which Mr. Randall is wrong, which are—first, uniformity of vertical wear, independent of the particular form of the surfaces; and, second, grinding effect *considered in connection with power* the only just standard of comparison. And my first assertion, that in this light the tractory conoid possesses no peculiar advantages, remains undeniably true.

Sun Francisco, May 5th, 1866.

FISHERMEN'S LEGENDS.—The fishermen round the wild headlands of Cornwall, England, have their legends, for sailors living as they do on an element full of mysteries, are proverbially superstitious. A pilot at St. Ives told Mr. Hunt a story of how one midnight, strolling on the wharf, to watch a vessel, afterward wrecked, that he had to take into Hayle, he saw a man, who refused to speak, leaning against a post. On looking closer, the pilot saw that there were pieces of seaweed and stick in his whiskers; that the flesh of his face and hands looked as if it were parboiled; and that as he walked the water 'squashed' in his shoes. The pilot was ill six months from the fright caused by this apparition. All along the Cornish coast the Phantom Ship is also believed in. Years ago, a vessel made signals of distress to the westward of St. Ives' Head. On reaching the ship, which was schooner rigged, and had a light over her bows, one of the sailors made a grasp at her bulwarks, in order to leap on board; but his hands met nothing solid, and he fell back into the boat as the ship and lights disappeared. The next morning a London vessel was wrecked at Gwithian, and all on board perished.

A BILL has been introduced into the House of Representatives, providing for the establishment of a government melting and assaying office in Salt Lake City.

ADMIT no guest into your soul that the faithful watch-dog in your bosom barks at.

[Written for the Mining and Scientific Press.]

From Mariposa County.

BY OUR SPECIAL CORRESPONDENT.

[Continued from page 274.]

Tho "dropping clouds hang low" to-day, and I find traveling rather disagreeable; but as my notes for the past ten days contain some points of interest, I think that I shall be able to employ an hour or two both pleasantly and profitably in writing them up for your columns.

On the day following my last writing I bid an early good-bye to my friend Snyder and his family, and before noon was in Mariposa, stopping by the way for a short chat with Mr. Homer, at Lovejoy's mill, twelve miles above town. This mill produces most of the lumber used in the vicinity of Mariposa, and also supplies a portion of the Merced River country. It is a steam mill, 24-horse power, with two circular saws, one of sixty, and the other forty-eight inches diameter. It is capable of sawing 8,000 feet of inch lumber daily, but is only kept running during the summer months, as the demand is not sufficient to keep it constantly employed.

After an hour or two spent in Mariposa, looking up old acquaintances and resting from my ride, I rode out to Bridgport to pay a visit to the mine and mill of

THE EUREKA QUARTZ COMPANY,

Four and a half miles southwest of Mariposa. The works are at present in charge of Mr. J. B. Bruce, at whose invitation I spent the night with him, and in the evening visited the mines. The company are working the veins, located in a granite formation, just outside the northern boundary of the Mariposa estate. Messrs. Washburn and Bruce have been able to obtain a lease from the Mariposa Company on favorable terms, and are working profitably on both sides of the line. The vein for which the mill was originally built is known as the Catron vein, from the name of its former owner. Its strike is north and south, with a dip to the east of fifty three degrees. The principal shaft is about 100 feet deep along the inclination of the vein, which in the works connected with this shaft will average nearly two feet in thickness, and has paid, as I was informed by Mr. Bruce, from $25 to $50 per ton.

From what is called the Dobbin shaft on a spur of this vein, some very fine rock has been taken, paying as I was informed an average of $50 per ton. The engine, of about 4-horse power, used for hoisting the rock from the principal shaft is run by a Chinaman, one of the former owners of the mine, who shows all the intelligence and thoughtfulness of a first class engineer. Chinese laborers are employed in almost every department of the work about this mine, both above ground and below, and Mr. Bruce expresses himself well satisfied with their services. The other vein lies about 400 feet east of the Catron, and has not been worked by the present owners. The old works extend to a depth of sixty-five feet, throughout which the vein appears to be about two feet thick, and very well defined and regular. Rock taken from this is said to have paid $16 per ton. The mill adjoins the hoisting works of the main shaft. It consists of a battery of eight stamps driven by a steam engine of 16-horse power. Amalgamation is performed in the battery, and on copper plates below, no amalgamating or concentrating machinery having been introduced.

On my return to Mariposa, I met Mr. Gus. Hite, from Hite's Cove, who had been in town for a few days, and was about starting on his return, accompanied by a party of Mariposans, among whom were Mr. Murphy, of Murphy & Brogan, and Mr. Swancy of the *Gazette*. At the store of Messrs. McDermott & Co., I was shown a map of the famous Hite & Wynant's mine, lately made by the County Surveyor. The vein has been worked to within twenty-eight feet of the east line of the Hite claims and at this point, it is eight and a half feet wide, and pays over $80 per ton. As Messrs. McDermott & Co., own the east extension of this vein, they are naturally well pleased with these developments.

In the afternoon I rode down to Bear Valley, where I spent the Sabbath, and on Monday morning paid a visit to the Pine Tree mine, and the Benton mill. The Pine Tree mine is paying at present better than at any previous time, the vein in the lower levels being about twelve feet wide, and paying according to the estimate of the superintendent, Mr. Dolan, about $15 per ton. It has been opened within the past year by a new tunnel 140 feet below the old works, and under the able and economical management of Mr. D. promises soon to become the most valuable mine on the Mariposa estate.

At the Benton mills, Messrs. Brannagim and Hall of San Francisco, are engaged in putting up machinery for the Ryerson amalgamating process, by which they have heretofore worked some of the Pine Tree rock with good success. The rock is first crushed between a pair of Cornish rollers, after which it is reduced to powder in a cylinder filled with two-ounce cast-iron balls, before being subjected to the superheated steam and quicksilver in the amalgamator. They expect to be ready to start the works in a short time. Through the kindness of Mr. Perian, I was shown through the mills, and spent a few hours very agreeably. One of Prater's Concentrators is now in use in the mill, of which Mr. P. speaks in the highest terms, but hesitates about introducing more until the fate of the Ryerson process is decided.

After leaving the Benton mills, I set out for the copper mines of the Chowchilla, arriving at Bennett's on Mariposa Creek, twenty miles below Hornitos, on Tuesday evening. The principal copper mines are located in a district of country lying in Mariposa and Fresno counties, and extending north and south about fourteen miles, with a width of three or four miles from east to west, the formation being a siliceous mica slate, or altered sandstone, in some of which are imbedded beautiful crystals of feldspar, of great curiosity and beauty. But few of the claims have been opened to any great depth, but the surface ores of many are very rich. These are principally carbonates and silicates with a small admixture of red oxides, and in some cases large masses of gray copper. But little ore has been shipped in its natural state from these mines, the long distance and scarcity of transportation, and the irregular character of most of the ores interfering greatly with the profit of shipping. There are two smelting furnaces in the district, which have been doing a very good business working the carbonates and silicates, which furnish from eight to twenty-five per cent. of pig copper, which assays from eighty to ninety-six per cent.

HENRY & COMPANY,

At James' Ranch, have a blast furnace of the pattern described in Dr. DeHeirry's articles on "Copper Smelting in California," with which they are able to reduce sixteen tons of silicates or carbonates daily. The ores worked thus far have averaged about twelve and one-half per cent., and about twelve tons of pig copper have been shipped. The works consume about five or six tons of charcoal daily, costing $17.50 per ton, and employ eleven men, making the cost of smelting copper from twelve per cent. carbonates, from $75 to $85 per ton. The furnace is employed in smelting ores from the Lone Tree and Green Mountain leads. As yet, no permanent vein has been discovered at either place, though the prospects, especially of the Lone Tree, are very good, though it is probable that the vein will not concentrate until a great depth is reached. The general superintendent of the works is Mr. Wm. Nelson, of Merced Falls, and the furnace is under the immediate charge of Mr. P. Desormaux, formerly of Meader & Co.'s smelting works at Copperopolis.

At Buchanan Hollow, six miles below James' Ranch, in the upper part of Fresno county are situated the works of

THE BUCHANAN COMPANY.

The furnace here was erected by Messrs. Haskell and Philips. It is a simple cupola, such as is used in foundries for melting iron, but after a considerable amount of unsuccessful experimenting, has at last been brought to work to the satisfaction of its owners. Its capacity is about the same as that of Henry & Co.'s, and the amount of coal consumed daily about the same, though it has been run more constantly, and has, as I was informed by Mr. Palmer, one of the smelters, produced about thirty tons of copper. At the time of my visit the furnace was idle for want of coal. Mr. Haskell was in San Francisco, and Mr. Philips had lately taken to himself a wife, consequently I did not see either of them.

About six miles south of Buchanan Hollow is

THE BACHMAN CLAIM,

Owned by Messrs. Bachman, Winchell, Leach, Ashman and others, principally of Millerton. The company own 680 acres of land by United States patent, which includes their mine. The course of the vein is nearly north and south, with a slight dip to the eastward, probably about thirty-five degrees. The shaft is about fifty-six feet deep, showing in the bottom a well defined vein, nine or ten feet wide, five feet of which contains much black oxide, and assays from eighteen to twenty-seven per cent. copper. Some of the carbonates from the surface were smelted by Messrs. Haskell and Philips, and yielded twenty-five per cent. of copper. As far as prospected this is one of the best veins I have ever seen in the State.

Another very promising vein is that of

GREEN & COMPANY,

Located two miles north of James' Ranch. The claim is 1,750 feet on what is known as the Dozer, a vein or series of veins which has been traced through the district for a distance of nine or ten miles in a northwest and southeast direction, and showing fine indications of copper throughout its whole extent. Green & Co. have sunk a shaft on their vein to a depth of eighty-five feet, showing a vein varying in width from one to six feet, the ore being generally very rich. In the bottom the vein is about four feet in width, about two feet of which is solid gray ore.

D.

Bear Valley, April 30, 1866.

CHEERFULNESS IN THE HOUSEHOLD.

Children are naturally cheerful. They hunger perpetually for new sources of enjoyment—of cheerfulness. A child needs smiles as much as flowers need sunshine. A silent household is as unwelcome and unsuitable to a child, as the shady side of a house is to flowers. There is no question but that too much reliance is placed upon Solomon's rod; and that that great institution is quite too often called into requisition to atone for the short-comings of parents and teachers. It is greatly to be feared that the cases are not rare where smiles or pleasant words would not serve a much better purpose. Parents who are habitually silent, or who seldom take an interest in the little pastimes which interest their children, need not expect that everything will go on smoothly and cheerfully in the household.

If a thing or a place pleases a child, he is apt to seek and love it; if it displeases he will most assuredly be inclined to avoid it. If parents are habitually silent, if their faces are always sour, their looks harsh and fault-finding, it is but natural to expect the children will seek to escape from such a presence whenever they can—that they will talk pontily about "being shut up there," and that they will often be guilty of acts which seem to call for the chastening rod. Many a child goes astray not by reason of any evil intent or desire, nor because of the lack of formal Christian virtue and example at home; but because of the want of kindness and sociability on the part of parents—the lack of sunshine and cheerfulness in the household. To the calm observer of such scenes, there is no difficulty in placing the responsibility where it belongs.

How often do we see parents who are "the life of the company" when they are abroad or when they are entertaining friends at home; yet when they sit down in their own household, silence and moroseness prevail. Is it any wonder that such parents should find their children disobedient and wayward? It would be most unreasonable to expect anything else.

Let parents exert themselves to be cheerful at home; let them look happy, always, in the presence of their children. Let them talk to them, take an interest in their little games, in their troubles and in their joys; and do so in a way to make them happy. Let them talk freely with the older ones, and so gain their confidence that in all their little affairs of boyhood or girlhood they can come freely to their parents for advice and consultation. Such children will learn to love their homes, and will seldom, if ever, be found engaging in matters of evil tendency or even doubtful propriety.

It is far better and more conducive to our own happiness, as parents, to please our children and make *them* happy, than to endeavor to charm strangers or amuse friends. Make your homes happy and cheerful—light them up with pleasant and instructive conversation, and you will never have occasion to mourn over the ingratitude or waywardness of your children.

THE Pacific Ocean covers seventy-eight millions of miles; the Atlantic twenty-five millions.

TRY to excel in all things.

From the Stock Circular of Associated Brokers of the S. F. Stock & Exchange Board.

SAN FRANCISCO, SATURDAY MORNING, May 12, 1866.

Little or no change is perceptible in the condition of the Money Market, save that a further accumulation of capital may be noted, together with occasional concessions in rates of interest to certain borrowers. Money is thought to be rather more plentiful than for some time past, and is likely to remain so the ensuing season. Discounts are made in bank at 1@1¼ ₱ cent. per month, and in the open market, upon first-class securities, loans are effected at 9@12 ₱ cent. per annum.

We learn that at a meeting of the stockholders of the Bank of California, held on Saturday last in pursuance of public notice, it was unanimously resolved to increase the capital stock of that institution to $5,000,000. We are also informed that some modification of the by-laws was made with reference to the sale of its stock. Of the new stock, $2,000,000 is to be issued at a premium of 25 ₱ cent, and $1,000,000 stock will be given to the old stockholders, out of the surplus accumulations of the Bank since its incorporation.

Receipts of Treasure from domestic sources, since the date of our last reference, amounted to $900.000, and the Branch Mint in this city, during the same period, has taken for coinage about $300,000.

Bullion met with no especial enquiry for Thursday's Steamer, and sales of Gold bars were made at 840@850. Silver is ruling at ¾@1 ₱ cent. premium.

Currency Bills on the Atlantic are offered at 23 ₱ cent. premium on gold. Telegraphic Transfers are made at 2¾ ₱ cent. premium ; and Sight Drafts, payable in coin, are selling at 1½@1¾ ₱ cent. premium. Sterling Exchange may be quoted at 48@48 ½d, for best Banker's Bills ; Commercial do, 49¼@49½d.

Legal Tender Notes are dull and inactive at 78¾@79c. Our latest telegraphic advices from the East, quote gold in New York on the 9th inst., at 128.

A very considerable advance has taken place recently in San Francisco City and County 7 ₱ cent. Bonds of 1864, and the following sales are reported : $33.000 at 77½c, $65,000 at 81@83¼c, and $20,000 at 82½@84c. Some $40,000 7's of 1865, were also sold at 85c, adding interest since May 1st.

City Stocks continue to be sought for at higher prices. California Steam Navigation was dealt in at 60@63 ₱ cent. ; Spring Valley Water at $67½, ex-dividend ; Fireman's Fund at $120, and North Beach and Mission at $60. San Francisco Gas is inquired for at $108 ; State Telegraph at $29 ; Pacific Insurance at $178, and Union Insurance at $120.

The Mining Share Market has shown less animation this week, but most stocks are higher than at the close of last week. The product of different mines is well kept up, and the aggregate yield of bullion for the current month will probably exceed that of April. If we may except one or two claims, the tenor of advices from Nevada is rather more favorable respecting recent developments.

Crown Point is strongly held, and trifling sales were made at $1,250 seller 60, and $1,350 cash, closing at $1,350 asked. Receipts of bullion last month, amounted to $116,516.23 from 3,125 tons of ore—an average of $37.27 ₱ ton. Of this amount, 1,155 tons were crushed at the company's two mills. During the week ending May 4th, 749 tons were extracted. The main shaft is down 102 feet below the 3d level. The suit of C. L. Low *vs.* this Company, for 56 feet of stock, resulted in favor of the plaintiff. A dividend of $80 ₱ foot was declared on Thursday last, for the month of April, leaving some $45,000 in the treasury of the company.

Savage fell from $1,040 to $1,000, and is now held at $1,030. During the week ending May 5th, 630 tons of ore were hoisted to the surface, as follows : 30 tons first-class, 373 tons second-class, and 227 tons third-class. The increased production comes from the 6th level, the lowest floor of which, north and south, continues to look well. The first floor is also getting into good ore. In consequence of an apprehended difficulty in overcoming any very considerable flow of water, without the aid of pumps, several works of exploration, projected a short time since, will not be commenced until the shaft reaches the 7th level. The two southern compartments of the Curtis shaft were sunk 20 feet last week, and the main shaft is now down some 35 feet from the 6th station.

Gould & Curry rose from $850 to $900, then sold at $890, and closed at $930 asked. The large flow of water met with recently in the south drift of the 4th station (825 feet from the surface), has been kept well under control, and it is now thought that the body of ore found above in the 2d station last February (150 feet south of the D street shaft), can soon be reached. The company have now at their credit some $70,000 ; all liabilities, both here and in Nevada, being paid, and but for the desire to retain a considerable surplus, in view of the extensive explorations in progress, and the probable deterioration of the upper portion of the mine, a dividend would at once be declared.

Hale & Norcross advanced from $925 to $970, buyer 30 ; dropped to $930, rallied to $960, and sold yesterday at $960@965. The receipts of bullion last month exceeded $62,000 from some 1,800 tons of ore. This company pay $15 ₱ ton for the reduction of their ores, and exact 65 ₱ cent. of the assay value. The incline from the 7th level is down 100 feet, and the mine is looking as well as formerly. A dividend of $50 ₱ foot was declared on the 10th inst., payable on the 15th.

Yellow Jacket has been actively dealt in, and some 220 feet were sold, advancing from $700 to $750, receding to $710, and selling yesterday at $705@$720. No official reports from this mine have been received in this city since the 25th ult., and we are therefore without authentic advices as to the aggregate product of ore last month, or the average yield ₱ ton. This information, together with the disbursements of the company for the month of April, have been sought, in vain for a week past, by a number of stockholders, and, without wishing to reflect upon the management in Nevada, we think it is proper to advert to such official tardiness.

Ophir has been less active this week, but some 330 feet were sold, receding from $525 to $505, advancing to $540, dropping to $515, rallying to $585, declining to $530, and selling yesterday at $537½@550. Advices from this claim are somewhat conflicting ; but in the main rather more favorable than last week. In running north upon the different floors of the 9th gallery, the body of ore shows an unmistakable deterioration in that direction, but in working south (to the 5th floor) larger deposits of ore have been disclosed. From that level 35 to 40 tons of ore are now daily taken, the better portion of which, treated at the Reduction Works and mixed with Gould & Curry tailings, is yielding about $100 per ton. The lower grade of ores, from different portions of the mine, are yielding about $30 per ton, at the Atlas & Woodworth mills. Product of bullion since 1st inst., including shipments in transitu, exceed $34,000.

Chollar-Potosi was in much better favor early in the week, advancing from $315 to $365, then declining to $315, rallying to $322½, and selling yesterday at $322½@330. Official advices continue meager and void of much interest. The upper stope of the Bajazette Ground is said to show some improvement, and the New Santa Fe station is also thought to look more promising. During the week ending May 4th, 814 tons of ore were sent to custom mills. The drift from the 1st station—new shaft—is in some 325 feet.

Belcher has been dealt in within a range of 325@350, closing at $332½@$335. Alpha is dull and inactive, and small sales were made at $310@320, closing at $320 asked. Empire Mill met with trifling sales at $180@182½.

Imperial fell from $140 to $135, rallied to $142, then sold at $125 @126, ex-dividend of $10 per share paid 10th inst., and changed hands at the close at $127@$126. The first clean up this month of the Rock Point Mill amounted to $13,965.

Overman rose from $74 to $80, and then sold at $$79½@$82½. Bullion rose from $95 to $110, buyer 30, receded to $82, and sold yesterday at $82. Confidence sold at $15, then at $40 (assessment delinquent), closing at $39@36.

Mining and Scientific Press.

Miscellaneous Advertisements.

One week, per square	$1 50
One month, per square	3 00
One quarter (3 months), per square	8 00

Advertisements of great length, or of special character, inserted by contract on the most favorable terms.

Mining Advertisements.

	If paid in Advance.
Notices of Meetings, per square, one week	$1 50 / $1 00
Notices of Meetings, per square, four weeks	4 00 / 3 00
Assessment Notices, of ordinary length, four weeks	7 00 / 5 00
Assessment Notices, of more than usual length, for each additional square	4 00 / 3 00
Delinquent Sales, per square, two weeks	2 50 / 2 00
Delinquent Sales, per square, three weeks	3 50 / 2 50
Postponements, per square, one week	1 50 / 1 00
Slips of Advertisements, printed for meetings	
sessments, per hundred	1 50 / 1 00
Advertising law blanks, circulars, and advice	Free

☞ *The space of ten lines of solid agate advertising type constitutes a square.*

Terms of Subscription.

The Mining and Scientific Press is published every Saturday morning (containing sixteen pages—size of *Harper's Weekly*) at the following rates:

One copy, one year, by mail, in advance	$5 00
One copy, six months, by mail, in advance	3 00
One copy, one year, by express	4 50
One copy, six months, by express	3 50
Five copies, one year, by mail, in advance	20 00
By city carriers, per month	50
Single copies	12½
Monthly Series (or parts), containing 4 Nos	50
Monthly Series, containing 5 Nos	62½

The Circulation of the Press, already extensive, is rapidly increasing, and substantial men who can profit by widely disseminating information of their business amongst the most intelligent, influential and industrial classes of the Pacific States and Territories will find no more effectual or economical medium for advertising.

PETROLEUM
Companies
Neatly Printed.

Stock Certificates of all kinds embellished with wood cuts and electrotype engravings. We devote special attention to the execution of all kinds of work required by Mining Companies, Machinists and Manufacturers.

CAUTION.

TO WHOM IT MAY CONCERN:—THE PUBLIC ARE hereby notified that a patent was allowed, December 27th, 1864, and issued June 27th, 1865, to Professor Henry Wurtz, for the use of sodium and amalgams thereof with quicksilver, in the extraction of precious metals from their ores. All persons using said amalgams, or purchasing or selling sodium or said amalgams for use in the treatment of gold or silver ores, are hereby cautioned that they will be prosecuted to the full extent of the law.

The patents of Professor Wurtz have been assigned to the Wurtz Amalgamation Company of New York city. It is the intention of the said company soon to appoint agents for California and the other mining States and Territories. In the meantime, applications for licenses to use sodium and its amalgams, may be addressed to the company, at their office, No. 57 Broadway, New York.

C. ELTON BUCK, Secretary.

ANNUAL REPORT
—OF THE—
Pacific Insurance Company.

IN COMPLIANCE WITH THE ACT OF THE LEGISLature of the State of California, entitled "An Act concerning Corporations," passed April 24, 1850, the Pacific Insurance Company of San Francisco makes the following Annual Report:

I.—The amount of the Capital Stock of this Company is SEVEN HUNDRED AND FIFTY THOUSAND DOLLARS, and paid in GOLD $750,000

II.—The amount of the Assets is ONE MILLION AND FIFTY ONE THOUSAND; FOUR HUNDRED AND TWENTY DOLLARS AND EIGHTY-SEVEN CENTS. $1,051,420.87

III.—The Company has NO DEBTS

IV.—The amount of Insurance effected during the year, and which remained in force December 31, 1865:

Fire	$12,973,949
Marine	484,408

This Company commenced underwriting Marine Risks, August 1, 1865;

V.—This Company insures against the following risks, viz., BUILDINGS, HOUSEHOLD FURNITURE, MERCHANDISE, RENTS, LEASEHOLDS, VESSELS IN PORT AND THEIR CARGOES, and other PERSONAL PROPERTY, AGAINST LOSS OR DAMAGE BY FIRE.

Also, on CARGOES, TREASURE, COMMISSIONS, PROFITS, and WAR RISKS, and ON ALL MARINE AND INLAND NAVIGATION RISKS, TO AND FROM ALL PORTS IN THE WORLD.

VI.—This Company will take on any FIRST-CLASS RISK not to exceed $75,000 (the limit fixed by law), and on all large risks will reinsure to an extent consistent with PRUDENCE in other RESPONSIBLE COMPANIES.

J. HUNT, President.
A. J. RALSTON, Secretary.

The Great Pain Annihilator.

DR. E. R. JOHNSON WILL WARRANT TO CURE ALL cases of Asthma, Fever and Ague, Catarrh, Sore Throat, and Womb Diseases. The Doctor's success is miraculous in cases of RHEUMATISM, NEURALGIA, CONSUMPTION, GOUT, PARALYSIS, INFLAMMATION OF THE EYES, and all other diseases that human skill can reach. Rheumatic Pains removed in five minutes. Some of the afflicted that visit him come from one to six hundred miles, and soon find relief. Persons at a distance can be cured at home by addressing a letter to Dr. Johnson, No. 700 Market Street, San Francisco, stating case, symptoms, length of time the disease has continued, and have medicine promptly forwarded to any part of the country, with full and plain directions. ☞Consultation by letter or otherwise, FREE. 16v12-1m

OUR NEW YORK AGENCY.

Mr. Geo. M Newton is our authorized agent in New York City, and will receive advertisements and subscriptions for the Mining and Scientific Press at regular rates. Sample copies of our weekly and monthly issues can be procured by calling upon him, at the office of the "Stockholder," No. 72 William street.

Oakland Water-Cure.

APRIL 1ST, 1864, WE OPENED A HYGIENIC BOARDING House and Ladies' Health Institute in Oakland. The great advantage we have experienced since that time, in the treatment and cure of all those diseases peculiar to females, as well as those common to all, over that of San Francisco, induced us to give up the treatment of gentlemen in the city. We have accordingly removed our entire Bathing, Electro-magnetic, and Gymnastic Apparatus, which we used especially in the treatment of males, to our Health Institute across the Bay, and have found, after a trial of seven months, that gentlemen as well as lady patients recover, at our Fountain Farm Cure, one-third faster, than in the city of San Francisco. The climate here is the most even and bracing to be found in the State. The grounds command a view unsurpassed in the world. The Institution is furnished with an abundance of pure, soft water, from numerous springs; and we now offer to Mill-hers, Teachers, Lawyers, Miners, Merchants, Mechanics, Farmers, and all other worthy persons, who desire to try the advantage of the only *rational* system of medicine, the hospitalities of our Hygienic Home and Cure. Young men who have become debilitated or lost their health by excessive toil, exposure, or enervating habits, contracted through ignorance of Physical Laws, may with us find more of the encouragements they need, and means that will restore them to health, than elsewhere in California.

We claim for Water-Cure and Hygienic Medication superior advantages over all systems of drug medication in the cure of all disorders, whether acute or chronic; that it is followed by none of those debilitating diseases, such as Piles, Chronic Diarrhœa, Torpid Liver, Constipation, Intense Nervousness, Neuralgia, etc., nor those terrible Secondary Diseases, known as Varicose Swelling of the Veins, Necrosis, or Decaying of the Bones, Ulceration of the Limbs, Mercurial Rheumatism, Cutaneous Eruptions, etc., which we well know result from the free use of mercury and other metallic drugs, together with stimulants and vegetable poisons given to overcome acute diseases.

The Oakland Water-Cure and Eye Infirmary is by far the most complete in its facilities for the cure of all diseases commonly treated in all Eastern Water Cures of any like establishment on this coast, and the only one in California conducted according to the Theory and Practice of the New York Hydropathic College. We use all forms of Warm and Cold Wet Sheet Packs, the Electro-Chemical Bath, Steam Baths, Improved Sitz Baths, Douch Baths, a Patent Spray Bath, and Magic Baths. The last named was instituted by Dr. Smith with special reference to the cure of those diseases peculiar to miners, namely: Rheumatism, Inflammatory or Chronic, Stiff Joints, Paralysis, Mercurial, Lead, and Oak Poisonings. It is a sure cure for Ague and Fever. It aids more than any other Bath we have used in eradicating all kinds of drugs and infectious poisons, and in the cure of all disorders induced by exposure to dampness and water, foul air, absence of light and electricity, retorting metals, the malaria of rivers and low marshy grounds. Where there was a fair constitution left when other drugs had been applied for months as dyers without a cure, we have, in the past seven years, treated successfully the following diseases: Chronic, Inflammatory and Mercurial Rheumatism: Paralysis; Lung, Bronchial, and Catarrhal Affections; Diseases of the Heart, Kidneys, Liver; Dyspepsia, Constipation, Erysipelas, Scrofula, Piles, Inflammation of the Bowels, Chronic and Acute Diarrhœa, and all diseases and weaknesses peculiar to male and females. No physician in California is so favorably situated for turning to immediate home comforts and Hygienic conditions that are indispensable to the speedy recovery of nervous and chronic invalids. We have the only truly healthful boarding place in the State for men, women and children, with plenty of saddle and carriage horses for the use of patients and boarders.

To that class of Diseases and Weaknesses peculiar to females, and the medication that Hydropathic or Hygienic physicians employ in their cure, do we invite the special attention of patients and their friends. The ease and rapidity with which females suffering from general or special debility, recover in the bracing climate of the Bay, under Hygienic Medication, together with the universal success that has attended the treatment of females at Dr. Smith's Institutions, (both in Sacramento and San Francisco), induced us to make this class of human afflictions a specialty of our Institution. We have treated (mostly in the cure), over 300 females, several of whom had been "bedridden" for months and years, and all have been decidedly benefited, and with but few exceptions, returned to their homes in from two to six weeks, so far recovered as no longer to need a physician. We have never yet learned of a single instance of a relapse into their former condition.

Any delicate female invalid in whom nature has been suffering from nervous debility or diseases peculiar to her sex, that cannot be permanently cured by spending from four to six weeks at our Cure, and at the mere cost of $100. This statement we make in confidence, from an experience of the last seven years. From the many we have been treated at our Cure, we have yet to learn of a single regret from husband or wife of the time or means they have expended in Hygienic Medication.

NEW YORK, Aug. 1, 1858.

To all whom it may concern:

This certifies, that Dr. Barlow J. Smith is a graduate of the New York Hygieo-Therapeutic College, which College has a regular Charter from the Legislature of the State of New York, and is authorized to grant Diplomas, conferring on its students all and the same privileges and immunities in relation to the practice of the Healing Art, that are conferred by the Diplomas of any Allopathic or other Medical College in the country.

Dr. Smith has also devoted much attention to Phrenology, especially in its connection with Physiology and Pathology, a portion of the time under the instruction of Fowler & Wells, of this city, and has labored successfully as a teacher and lecturer on these subjects.

R. T. TRALL,
Principal New York Hygieo-Therapeutic College.

To all whom it may concern:

I have known Dr Barlow J. Smith, both in our office as a Student, and a practical Phrenologist in the country, and from what I know of him I can cheerfully recommend him as an honest, faithful deliverer of character, and as such can cheerfully recommend him to the public.

For the good of Science.
L. N. FOWLER, 308 Broadway, N. Y.

Dr. Smith spends a part of each day in San Francisco, attending to family practice and to Phrenological and Physiological examinations at his office, Room 13 Armory Hall, up stairs, corner Montgomery and Sacramento streets. Office hours from 11 A. M. to 2 P. M. Circulars sent on application. Address,

BARLOW J. SMITH, M. D.,
20v11tf San Francisco, Box 473.

Important to Californians.—Many inventors have lately had their claims for Patents seriously (and in some cases fatally) delayed by the unqualification of agents who have not complied with the Government license and revenue laws, as well as other new and imperative regulations. These discrepancies, although arising from the inexperience of honest agents, are none the less dangerous to applicants for patents, whose safest course is to trust their business with none but active and experienced solicitors. The Mining and Scientific Press Patent Agency has strictly complied with the requisitions of the Department, and properly filed all necessary papers as Claim Agents.

Subscribe for it.—The large, illustrated sixty-four column weekly newspaper—the San Francisco Mining and Scientific Press—should be taken by every miner, prospector, and intelligent citizen throughout Colorado, as it gives a mint of most useful information to be gained no other way, on mining matters generally.—[Rocky Mountain News.

Engraved to Order.—Persons who desire to illustrate their individual establishments or business, should give us their orders for Engraving and Printing, and we will guarantee good work and reasonable prices.

DEWEY & CO.,
Patent Agents, Publishers and Job Printers, 505 Clay st

By Express.—Two cents per copy will be added to our usual rates of subscription (to pay Wells, Fargo & Co.'s tariff) on papers sent by express. If connecting expresses in the interior make additional charges, subscribers must themselves settle the same.

Mining Summary.

CALIFORNIA.

Alpine County—

Rumors of a rich strike in the George Washington have been rife, but as the tunnel is kept under lock and key, nothing definite is known by outsiders. The Monitor *Gazette* of May 5th, says: "Hints are thrown out by some that the pretended secrecy is only a blind to make stockholders think something is up that they may be anxious to pay the assessment now due, and again it is said all those who have the inside, when narrowly scrutinized, exhibit all the symptoms of a "good thing" on the brain.

Some speak thus of the Sailor lode: Mr. Payne has shown us samples taken from points uncovered by him all along for a distance of nearly a mile, bearing unmistakable evidence of unity and continuity.

The Silver Mountain *Bulletin* says of the Pennsylvania company: "The upper tunnel is now in 200 feet, and has been run parallel with the ledge on the east side, having cut across it three times in that distance; each cutting having shown an improved appearance in the vein stone. The last cutting occurred the present week, revealing a solid ledge of full ten feet in thickness, and the quartz glittering with the ruby."

* * * * * *

"The lower tunnel is now in 260 feet, but from present indications, ore sufficient can be obtained from the upper tunnel to keep a 20-stamp mill in active operation for two years; the lower one can then be gradually driven in, so as to tap in time to keep up the supply.

"The Winchester, having delayed too long their timbering, have had a cave, which will retard the work for weeks.

Amador County—

The *Ledger* of May 5th, has the following items:

We learn that the Vaughn claim, at Pine Grove, is yielding very rich rock. Last Tuesday they "struck it" richer than ever.

We learn that work will soon be commenced on several of the copper claims in the Forest Home district. Among those mentioned are the Exchange, Mountain and Star companies.

The hill claims of Elkins, True and others, at Forest Home, are still paying handsomely.

Mr. Benj. Fenton has been sinking a shaft on the Spanish claim, about two miles from here. After sinking to the depth of one hundred feet or more, he commenced drifting, and during the past week, struck the ledge and is taking out some very rich rock.

The Ione City copper mining company, whose claim is located on the celebrated Newton lode, have struck a vein of very rich ore—equal to the best found in that district. The stock in this company is now looked upon as a good investment.

The *Dispatch* has "been shown a very rich piece of quartz rock, recently taken from the Golden Eagle claim, about one mile from Pine Grove in this county.

Butte County—

Great excitement exists in the vicinity of Cherokee, in consequence of the discovery of silver ore, which is said to assay as high as $270 to the ton.

Calaveras County—

The *Courier* says: "In one year hence, the Keystone, which is believed to be as good as the Union, will take its place among the great paying mines of the world. The Empire mine, though unprofitable at present, presents unmistakable evidence of permanence. The Calaveras, we are sorry to say, has been idle a long time, notwithstanding the fact that when worked, it yielded largely of first-class ore.

The amount of Union mine copper ore, shipped from Stockton to San Francisco, since the first of January last, is 2,349 tons, 1,087 pounds.

Fresno County—

The copper mines seem to be attracting the attention of miners and speculators. Many are of the opinion that the region will prove richer than Calaveras county.

Nevada County—

The *Union* of May 6th, says: "We yesterday saw some excellent rock taken from the Stockbridge mine, on Rocky Bar. The rock is rich in gold and sulphurets. The Sebastopol mill is engaged in cleaning up waste dirt from this claim, which will pay an average of about $12 to the ton."

Sixty-three tons of rock from the claim of Pratt & Co., Scadden Flat, crushed a short time since, paid $75 to the ton. The mine is a continuation of the celebrated Massachusetts lead.

From the *Gazette* we learn that the Mammoth company, whose claims are located up Deer Creek, and near the Snow Mountain ditch, have laid open their lead for a great distance and are now taking out some beautiful looking rock.

Another new lead has been discovered near the Snow Mountain ditch. Free gold was found in the croppings.

Rich veins of quartz have recently been reported in Eureka township. The *Gazette* visited the locality in order to judge for itself of the mines, but found them as yet undeveloped to any extent. The surface rock looked well. In Kirby & Ryan's claim, says that paper, the ledge has been stripped to a depth of from three to six feet for a distance of about two hundred feet, showing an average width of nine or ten feet. Free gold is plainly to be seen in any part of the vein thus exposed. The owners propose to sink a shaft, and take out one hundred tons of rock, to be tested by mill process.

The same paper speaks of several mines in the same district, not of late worked for want of means, and closes the article thus: In our opinion, all that is required to make Eureka township the most prosperous portion of the county is the necessary means to develop the quartz mines within its limits; and from present appearances, they will soon have all they desire for this purpose.

Copper.—The *Gazette* says: We have been shown some specimens of ore from the Thorp copper ledge, taken from a shaft now being sunk on the second extension from the original location. A considerable quantity of ore, some ten or twelve tons, has been raised from the shaft, all of which looks equally as well as that taken from Thorp's shaft. The specimens shown us are very rich. We are informed that the ledge has been traced across Bear river into Placer county.

Same paper of the 4th inst. says: We were shown yesterday, by T. T. Davenport, some specimens of copper which he brought up the evening before from the ledge on Greenhorn. One specimen, taken from the bottom of the shaft of the original location, was composed almost entirely of the black oxide ore, and is evidently very rich. The shaft is now down twenty feet, the ledge being eight feet in width, and as yet only one wall has been found. About twenty tons of the ore is lying on the ground. An assay of average rock, made a week ago in San Francisco, gave twenty seven per cent. of copper. This ledge is called the "Fox Ledge." It is in Little York township.

On the 3d inst., the Columbia Mining Company filed its certificate of incorporation in the clerk's office, at San Francisco. They intend to operate on this ledge. The capital stock is $110,000, divided into 1,100 shares of $100 each.

The Territorial *Enterprise* of May 3d, thus sums up the news from Excelsior district: At Meadow Lake (formerly Summit City), the snow is now about seven feet deep; about two feet more having been deposited there by the late storm. The weather is nevertheless pleasant and mild, and the snow melting off very fast. * * * * *

A body of very rich ore has recently been struck in the Knickerbocker ledge, belonging to the California Company. It is estimated that the rock that is now being taken out will yield upward of $500 per ton. Considerable excitement exists in that direction at present, in consequence of this rich development, and parties are busily employed in looking up their claims in the immediate vicinity, and are taking means to fully preserve all their rights and titles thereto. The arrivals in the district are about on an average of thirty daily. None of the mills are running at present; they have stopped to make some necessary improvements. The material of the newspaper which is to be started at Meadow Lake, is being packed in by Chinamen. A portion of the press, which weighs 500 pounds, is carried on long poles by forty of them. When our informant left, they had arrived nearly into the Enterprise camp.

The Enterprise, Winton, and California mills are in constant operation, and all of the rock is paying big. Four other mills are on the way, and will be packed in as soon as possible. The population is increasing very fast, mostly from the State of Nevada. We predict in about six weeks it will be the liveliest place in the State.—*Nevada Transcript, May 4th.*

Placer County—

The *Herald* says that the Poland company, located on the new quartz ledge recently taken up west of North Ravine, and about one mile and a half from Auburn, have had an assay of their rock, which yielded at the rate of $1,140 to the ton.

The same paper, under the heading "*a monster mine*," has the following: "The Baker & Crosby mine at Whisky Diggings, about ten miles in a southerly direction from this place, is one of the largest in the known world, while it differs from all others we have ever seen or heard of. The mineral vein is about one hundred feet in width, and seems to consist of a heterogeneous mass of ores, rich in gold, silver and copper. In the copper streak native silver is profusely scattered. The ore is so soft that the 4-stamp mill in operation at the mine crushes it as rapidly as a 20-stamp mill would reduce ordinary quartz; and last week the employees, taking advantage of the fall from the mine to the mill, set sluices and washed the ore down to the battery."

The following items are from the Dutch Flat *Enquirer*:

The Cedar company cleaned up, from a run of twelve and one-half days, $2,850.

The Badger company, after a run of twelve days, realized $2,230 over expenses.

The miners of Thompson's and Gray's Hills are agitating the question of laying an iron pipe from the end of the Dutch Flat water company's ditches to the end of Thompson's Hill.

The *Stars and Stripes* says: "E. M. Hall Esq., goes to New York, on the steamer of the 10th inst., for the purpose of enlisting the aid of the capitalists of that city in the development of the Placer county mines.

Plumas County—

The Quincy *Union* says—"The New York Company at Sawpit, have finished cleaning up. The company took out about $14,000 for three months' work in their claims. The Eagle Company have not quite finished washing up their pay dirt. This company will take out over $24,000. The Union Company have just commenced washing. Their dirt prospects well, and they calculate to take out a mint of money. The Franklin Company are washing the dirt taken out of the 'front' channel. They are getting coarse gold. Brown & Delany have been piping all winter, and have commenced cleaning up. The Comet Company intend commencing work in their tunnel in a short time. We are told that Crescent Mills is the liveliest town in the county at the present time. The Crescent Co. employ ten teams in hauling quartz from the Premium and Plumas ledges alone. Both of their mills are running, new buildings are being put up, and the place presents a business like appearance.'

Santa Clara County—

New Almaden.—We learn that the difficulties at the Almaden Quicksilver Mine have been settled, and that the company will soon resume work."

Shasta County—

The following items are from the *Courier*:

The Spring Creek Quartz Co. will commence next week to clean out their ditch—filled by the heavy storms of the winter, in many places—and to put their mill in order, not only to crush rock of their own, but to do custom work.

The number of persons interested in the Highland is now reduced to four. The mill will soon re-commence work.

Mr. Kelly has bought one half the Jollie lode, and will immediately erect a mill on it.

Work has been commenced by the Union Company, Lower Springs.

The Pitch Pine lode, near Whiskytown, and four and a half miles from Shasta, prospects better than any lode discovered in this district. Work, which was suspended during the rainy season, will be resumed in a few days, and continued until the ledge is fully proved.

At a meeting of the miners of Quartz Hill, Buckeye and Churntown, convened at Buckeye, Shasta county, California, April 28th, it was declared by a large majority—nearly unanimous—that Chinamen will not be admitted to work in the mines east of the Sacramento river, in said county.

Sierra County—

We glean the following items from the Downieville *Messenger*, of the 5th inst.:

The Sierra Claims, at Chancellorsville, for five weeks' run cleaned up $2,700.

We have general good news from Howland Flat. The Hawkeye claims, at Potosi, are running the main tunnel ahead, and a few days since struck what they thought worth prospecting. Six car loads returned two and three quarter ounces. We are pleased to hear of the renewed prosperity of the Hawkeye.

A correspondent writes from Port Wine: "Matters about our town are looking up again after a long suspense and rather gloomy prospects. The Gate, Erie and Monte Cristo claims are again paying well, and the prospects of other companies promise to follow suit in the course of the season."

Throughout the entire northern portion of this, and the south side of Plumas county, mining operations are very brisk, and the claims paying uniformly well; some of them extraordinarily. The yield of gold it is thought will exceed that produced during any previous year.

The Sears Union Water Company are about to extend their ditch through St. Louis and Port Wine to Scales' and Poverty Hill.

Siskiyou County—

The Yreka *Union* of 5th inst., says:

We are informed by Mr. Thompson, of Scott River, that Williams & Co., of that place, took out $1,400 on the 20th ult., and since that time have taken out nearly $4,000.

The mines on Humbug are paying better this spring than ever before. The claim of Messrs. Miller & McKimmey has been paying $100 per day for the past week.

We understand that several new quartz ledges have recently been discovered in the vicinity of the famous Schole ledge on Cedar Gulch, Scott Valley.

Tulare County—

The Visalia *Delta* of May 2d, has the following from a correspondent in Havilah: "Next week, Pieper's, Raud's, Thomas', Marsh & Kennedy's and the General Grant mills will all be running, and we are expecting great results. McKidney and Burdett made a good thing of their purchase of the new lead known as the Jo. Walker. They have just sold a one third interest for $22,500. They paid $3,000 for the whole. New lodes are being discovered every few days."

A new district has been discovered near the head waters of Erskine Creek, and just over the ridge from the Mt. Sinai district and Claraville. The leads are said to be large, well defined, and of wonderful richness. About one hundred men have left Clear Creek for the new district.

Yuba County—

The miners in Smartsville left their work at 9½ o'clock in the morning, proceeded to the claim of R. W. Creary, who had employed some Chinese to work in said claim, "quietly loaded up the Johns with their traps," and marched them out of town. They then assembled in the town hall, and after appointing a President and Secretary, proceeded to form a permanent organization, to be known as the "Union League of White Men," for the protection of white labor.

NEVADA.

Virginia—

We gather the following items from the Territorial *Enterprise:*

The Imperial is now running a drift at the 50-foot level westerly towards the red rock portion of the ledge. At present this mine is considerably troubled with water in their lower level, but have managed so far to keep it under.

We examined, on yesterday, a small lot of very rich silver ore, taken out of the Kentuck mine, Crown Point Ravine, at the 275-foot level. It was very rich, and a ton of the same sort was estimated to be worth $10,000. There is more of it.

Reese River—

The *Reveille* thus describes a specimen from the Yankee Blade mine, calling it a premium specimen:

It is fourteen inches long by ten inches wide, and about five inches thick, and presents on one side a gorgeous mass of light violet colored ore, of high metallic lustre, dotted and fleeked at every point with dark rich ruby; and on the other side there are little clusters of iron pyrites, rich in silver, blended with dark rich silver sulphurets and ruby. It is altogether the finest specimen yet exhibited in the country.

The same paper speaks of the North Star and Oregon mines:

Work is steadily pushed on the mines, and the Oregon, which has been opened through an incline of great depth, is exhibiting a splendid ledge, and the ore extracted in the course of exploration has already produced a large dump. The North Star keeps pace with the Oregon, and is daily improving in appearance; and as the drifts are pushed in marvels of treasure are disclosed. On the surface lies a large pile of its wonderfully rich ore, exhibiting ruby almost in every piece, and looking as though the heap had been sprinkled with blood.

Of the Roanoke: The vertical shaft has been sunk to the depth of two hundred feet through rock of adamantine hardness, which, however, during the last several days has changed it character, and is apparently softer.

A new district has been organized under the name of "Eastern White Pine." It is on the eastern side of the range of mountains of the same name.

John Frost reports very favorably of the advantages of the new location, both as regards the character of the mineral and the abundance of wood and water. According to his statement, the veins discovered and located range from four to ten feet thick, and the mineral brought in by him was procured in every instance from the croppings.

In the shaft and incline on the Southern Light, adjoining the Savage works, a body of excellent ore is being uncovered, which will yield very handsomly. Work has just been resumed in the original incline, which has already been pushed to the depth of over two hundred feet; and a level, of sixty-five feet in length, will connect it with the work near the Savage.—*Reveille.*

The Stella Hoisting Works were "inaugurated" the other day.

"Hot Creek" is the name of another new district, eight miles southeast of Austin.

From the Nye county *News* we select the following items:

The Suecor Mill, formerly known as the Pioneer of this place (Ione), which started up a little over a week ago, has reduced the price of crushing ore from $65 to $55 per ton.

Esmeralda—

The *Union* of April 28th, says that Mr. E. O. Taylor has been sent out from Philadelphia by a company of capitalists, to develop several ledges belonging to the company. He has already commenced a shaft on Last Chance Hill. Fifty thousand dollars worth of machinery has already reached San Francisco on the way to the ground.

Mr. Gallagher of Aurora, called on us the other day, and gave us an item in regard to the Crockett mine, of which he is the superintendent. A lot of the rock crushed a few days ago at Poor's mill, yielded nearly one hundred and fifty dollars to the ton.

We see by the Esmeralda *Union*, that Mr. Gallagher is spoken of as an especially efficient and economical manager.

Black Rock—

The Red Bluff *Independent* says: "Notwithstanding the many stories about Black Rock mines being a humbug, we understand that parties from San Francisco have confidence, and that Mr. Huff, well known in northern California, together with others, have visited the mines, and being satisfied of their richness have returned to San Francisco with the intention of sending out a twelve-stamp mill. Red Bluff is only 200 miles west of Black Rock, and a good road all the way."

ARIZONA.

One hundred tons of copper ore from the Planet had reached the mouth of the Colorado, was to be reshipped for San Francisco. The ore is said to sell in this city for $220 per ton.

It is said that a company is to be formed in San Francisco for the purpose of exploring Arizona in search of that mountain of decomposed quartz, reported to have been discovered by the three men who escaped from their ten Indian captors, after having been in their hands for ninety-four days. A fully armed body of men numbering one hundred, is willing to beard the monster Apache in his den, on the strength of the story.

A correspondent of the *Flag*, in a letter from Fort Grant, says: "At various points along the Colorado river, gold has been found disseminated in the soil, some spots yielding rich, others nothing. Chimney Peak on the Colorado, was at one time a favorite locality. La Paz, one hundred and eighty miles above Fort Yuma, was a few years since a great attraction. It contained in 1863 about eight hundred inhabitants. Water is scarce in all these diggings. Some Mexicans still make small wages in the vicinity by dry washing. Rich diggings were found on the Hassayampa, better known as Weaver diggings, a few years ago, but they were soon worked out. In fact, it may be said, though rich placer mines of limited extent have been found in Arizona, no extensive mines of that kind have as yet been discovered. If any such exist, they are at present within the dominions of the Apaches." A few weeks ago, the United States Marshal Major Duffield showed us some specimens of silver lead ores, argentiferous galena of great richness, taken out of the Santa Cruz mountains, east of the town. The ores of silver found in Arizona are argentiferous galena, native silver, auriferous sulphuret of silver, black sulphuret of silver, sulphate of silver, and sulphate of iron combined. The gangue is usually quartz or feldspar." * * * * *

"Copper mines are efficiently worked at different points on the Colorado river. Whilst many of these mines have and will prove failures, others from their accessibility to steamboat navigation will prove to be valuable. The ores of copper found in Arizona are usually the sulphurets, principally gray."

IDAHO.

The *World* of April 14th, reports the new steamer on Snake river to be nearly completed. She will run between Olds' Ferry, which has been removed twelve or fifteen miles down the river, and a point on snake river, about thirty miles from Boise City, and thirty from Owyhee. The landing will be about sixty-five miles from Idaho City.

"One of the claims of Moore & Co., on Buena Vista Bar, under the supervision of Charley Young, Esq., cleaned up this week, after four days run, and weighed out about five hundred ounces. The claims along the bluff are generally doing well."

On the question which has been so much agitated of late, a letter from Owyhee to the Trinity *Journal* says: "There is much contention as to which is the most feasible route for business with this Territory, but the preference is almost universally in favor of the one starting from Chico, on the Sacramento, because it is the nearest and the best natural thoroughfare yet opened."

MONTANA.

The Blackfoot correspondent of the *Santa Cruz Sentinel*, says that Elk Creek, in regard to which so much excitement existed at last reports, is fast losing favor; and that Blackfoot is thus far "the best camp on the west side of the mountains." Quite a lively town is springing up at Carpenter's Gulch.

Speaking of the routes, the same says: For passengers the quickest route is by overland to Salt Lake, and thence by stage to any portion of the Territory. The cheaper way would be *via* Portland across the Cour de Alene mountains.

The probabilities now are that the mouth of the Musselshell will be the head of navigation of the Missouri, as nearly all the dangerous shoals are between that point and Fort Benton. A town site is located, and the road from there to Helena is being put through fast as possible. He closes his letter thus: I have no doubt but many will be disappointed in the country, but can assure you that the country is no humbug, the many reports to the contrary notwithstanding.

A correspondent of the *Post* writes from Blackfoot, April 10th: Already a few of the more favorably located claims have commenced washing, and invariably with results highly satisfactory. Ophir creek will be worked for miles above and below town, and the creek undoubtedly contains many rich claims. The mines on Carpenter's bar and Prairie gulch are considered by many to be the best in the vicinity of this place. Several new discoveries, both east and west of Blackfoot, have been made during the winter, and between Snowshoe and Little Blackfoot creeks, two new districts have been formed. A ditch has been surveyed and, I understand, will be prosecuted to completion as early as possible, to convey the water from the latter sufficiently high to cover the new diggings. There is a large scope of country between these two streams that prospects well, and only remains untenanted from the want of water to work the ground.

* * * * * *

From No. 8, below discovery on McClellan gulch, $12,584 were taken last week, the result of five day's run with one string of sluices. I am also informed that $3,744 was cleaned up from a single day's run, on the same claim, since. This, considering the disadvantages of working at this season of the year, is pretty good, even for Montana.

It is said that Greathouse & Kelly are about starting a line of stages between Boise and Helena.

The Pittsburg, Pa., *Dispatch* says that the steamboat Peter Balen, from Pittsburg Pa., to Fort Benton, will be the first of a line of packets, direct from the iron region to the gold region. The boat is a model river steamer, said to be the finest on the Western waters. She is armed with two brass swivels, and her pilot house is bullet proof. The distance to be traversed by the Peter Balen is four thousand six hundred miles. The vessel is one hundred and seventy-five feet keel, thirty-seven feet beam, and five feet depth of hold. She carries a sawing machine to cut the wood necessary to run the Upper Missouri. The fare to any of the Montana cities is $320 from Pittsburg, and $300 from St. Louis. Captain Joba Williams is in command.

The Gold Hill Mining and Tunneling Company has been organized for the purpose of tunneling for Gold and Silver Lodes in the district granted to them by the Legislative Assembly, located Grunite creek, containing 264,000 square yards of ground. W. R. Gardner is the agent.

Hydraulics.—The *Post* of April 21st says: The Nelson Mining Company got up steam at the Hotel de Murph, on Thursday afternoon, and both engines worked admirably. A large number of citizens witnessed the first performances of the hose on a bank of refuse dirt, and all seemed pleased with the highly effective action of the stream directed upon it from the nozzle. The miners are as busy as bees in July, all along the gulch. The gold is as yellow as ever, and just as tempting.

We learn from a reliable source, that a dry gulch has just been discovered between Bivens' and Harris' gulches, which bids fair to be rich. It was discovered by Mr. Huffaker, of Bagdad, in Bivens' gulch. The gold is course, weighing from fifty cents to $2.00 to the piece. The first day Mr. H. panned out $15. Quite an excitement exists in that vicinity. It is proposed to extend the Ramshorn ditch, so as to bring water into the gulch, and this will be done as soon as the frost gets out of the ground sufficiently.

A correspondent of the same, at Pipestone, says: Some new lodes have been opened this spring. One called the Clipper, struck by Messrs. Garrett & Kipp, is about five feet in width, and is undoubtedly a rich lode; nearly all of the rock shows free gold. A tunnel is being run into the Emigrant, and the ore bids fair to go ahead of any other in the Park. From one and a half pounds of ore, taken at a depth of forty feet, was obtained ninety-four cents, and there appears to be plenty of the same sort left. A large quantity of ore is ready for crushing. Workmen are busily engaged in getting ore out of the Geneva. This lode shows fully eight feet in width, and the ore is rich. From one pound of average rock, taken out at a depth of fifteen feet, seven cents of coarse gold was obtained.

* * * * * *

The miners have commenced work on the bars on the Big Pipestone, and are doing well. On the Little Pipestone, they report taking out an ounce per day to the man.

OREGON.

The Umatilla *Index* says that four men who were prospecting the Cinnabar mines, thirteen miles from Canyon City, were attacked by nine Indians—one was wounded. The citizens are forming themselves into companies for their protection.

New placer diggings have been discovered within ten miles of Canyon City, near the road, paying from twenty cents to one dollar to the pan. One wheelbarrow load of dirt yielded eight dollars.

Rucklo & Co.'s quartz mill, in Powder river valley, cleaned up $8,000 after one week's run. The Blackfoot fever is abating, and parties are returning to Idaho City. The mines are opening well and labor is high, eight dollars per diem.

COLORADO.

The following items are from the Colorado *Journal*, of April 12th:

There was a lode struck yesterday in Russell, named Comstock, recorded and bonded for $12,000.

It is said that the extension of the Kingston, famous lode in Russell, has been struck. The ore is the same and the crevice five feet in width.

Mr. Huddleston sold the Texas lode in Rome, N. Y., for $32,000.

Charles H. Sherman has organized a company on the Sherman Lode, situate on the hill east of the Bobtail and Fisk, and has a working capital of $70,000, which he is coming on to apply to the development of said mine.

Mr. Garrison last week sent off 80 ounces of gold from his new mill.

Times never appeared so encouraging to us since 1863.

Copper.—A gentleman of Ward district took East 40 ounces, avoirdupois, of ore from the Columbia lode, and smelted it in crucibles, getting a little more than 11 ounces of pure copper, or more than 25 per cent. It made quite a sensation.

City College Laboratories,

Southeast Cor. Stockton and Geary sts.

Practical and Analytical Chemistry and Metallurgy.

THOMAS PRICE,

Professor of Chemistry,

(Formerly of the Normal College, Swansea,)

WILL GIVE PRACTICAL INSTRUCTIONS IN QUALITative and Quantitative Analysis and Assaying. The course qualifies students for the application of Chemistry to METALLURGY, MANUFACTURING ARTS, and MINING PURPOSES.

PHARMACEUTICAL and TECHNICAL CHEMISTRY, such as is required by Medical and Pharmaceutical Students, will be taught to such students as may require it.

Course of General Chemistry.

Evening Lectures will be delivered every Tuesday, at half past seven o'clock, P. M., in the Philosophical Hall of the College, without extra charge to the students in the Institution.

On and after the 14th of February, the Laboratories will be open every day, except Sundays, from 8 A. M. to 5 P. M. For further particulars, address

REV. P. V. VEEDER,
Principal of the City College.
6v12tf Or at 406 California Street.

SANTA CLARA COLLEGE, S. J.,

SANTA CLARA, CAL.

Conducted by the Fathers of the Society of Jesus.

The FIFTEENTH ANNUAL SESSION of this College will commence on

Monday, August 28th, 1865.

TERMS—Tuition in the Classical and Scientific Department; Boarding and Lodging; Washing and Mending of articles washed; School Stationery; Medical Attendance and Medicine; fuel, light, baths, etc., per session of ten months..... $350

For further information and catalogues, apply to the President of the College, or to Rev. A. Maraschi, St. Ignatius College, Market street, San Francisco.
3v11 REV. A. MASNATA, S. J., President.

SACRAMENTO SEMINARY.

It is Impossible for editors to know ALL the merits and demerits of their correspondence, consequently the reader must not receive the opinions of our contributors as our own. Intelligent discussion is invited upon all sides and the evidence of any error which may appear will be received in friendship and treated with respect.

American and Foreign Patents.—Letters Patent for Inventors can be secured in the United States and foreign countries through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past two years.

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the MINING AND SCIENTIFIC PRESS, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

Payment in Advance.—This paper will not be sent to subscribers beyond the term paid for. The publishers well know that a good journal cannot be sustained on the credit system.

Mr. Wm. R. Bradshaw, is our Special Correspondent and Traveling Agent. All favors or assistance rendered him in his progress through the country in behalf of our journal, will be duly acknowledged.

SAN FRANCISCO, Jan 1st, 1866.

Mr. A. C. Knox, is our fully authorized Traveling Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office.

SAN FRANCISCO, Jan 11th, 1866.

Mr. I. N. Hudson, is authorized to solicit subscriptions, advertising, etc., for the MINING AND SCIENTIFIC PRESS, in San Francisco, and to receipt for the same.

Mr. S. D. Woods, will correspond and act as Agent of the MINING AND SCIENTIFIC PRESS in the interior.

San Francisco:

Saturday Morning, May 12, 1866.

THE SAN JOSE RAILROAD MACHINE SHOP.

We took occasion, a few days since, to visit the Machine Shop of the San Jose Railroad Company, under the superintendency of Mr. R. R. Bishop, Master Machinist of the road, and were shown by him through all the different departments. We were much surprised at the completeness of the arrangement for the manufacturing or repairing of all kinds of railroad machinery. The car building department is a large and conveniently arranged building, where they can turn out first-class cars, complete, with as an elaborate a finish as any establishment of the kind in the Eastern States, and at a price much less than the cost of importation. In the machinist room the Company have under the management of Mr. Bishop,—whose skill as a mechanic in that particular line of the art cannot be excelled,—some of the finest pieces of mechanism in the shape of turning-lathes, drilling-machines, etc., which we have ever met with; these machines were moreover the product of American ingenuity. One thing in particular that attracted our attention was one of McKenzie's Elevators, with which one man can with the utmost ease place a car axle on the lathe, the endless chain of the Elevator fitting into the groove of the blocks in such a manner as to prevent the weight to be raised from falling. The machinery is driven by one of Hondley'e Engines which, by the by, is the most compact and economical thing of the kind often met with, and which does its work noiselessly, cheaply and effectually. Mr. Bishop informed us that the Engineer does as much work in the shop, besides attending to his engine, as any man he has; and the whole cost of repairs since the engine was first put up, some months ago, had been but twenty-five cents. We noticed the workmen busily engaged in turning the bearings of a lot of car axles, just passed over to them from the Pacific Forge Company's Works, now in successful operation close at hand, and at a less cost than imported ones, and in quality much superior. We take much pleasure in noticing such evidences of enterprise wherever found.

WHEN a vain man makes up his mind, he might well feel mortified at the smallness of the package.

THE BLUE LEAD OR CEMENT MINES.

Recent developments are attracting an unusually large share of attention to what is generally known as the "Blue Lead" or cement mines, which are found occupying a belt of country from two to three miles in width, and extending from the Feather river on the north, to the Merced on the south, a distance of upwards of 200 miles. All admit that this gravel or cement overlies the dry bed of an ancient river; but whether that bed once formed one continuous stream, or whether there may have been several streams running in the same general direction, and having their outlets along the coast of a great inland sea, or otherwise, is as yet a matter to be determined.

It is to be regretted that so little attention has hitherto been paid to data of interest, in connection with this valuable and extraordinary deposit. Some considerable space is devoted to its consideration in the last published volume of the California Geological Survey; but not sufficient to render the observations there recorded of much practical or scientific value. It is proposed, however, by the Survey, at some future time to connect together these various river channels, and thus reconstruct the system of water courses by which the Sierra has been furrowed, in an age long gone by, and before the present system of rivers could have had an existence. The practical value of such a work can scarcely be estimated in the aid it would render the miner as a guide to his explorations, and in giving a clue to the extent and duration of this valuable class of mining.

What is called the "blue lead" proper, is a narrow belt of hard cemented blue gravel, varying from fifty to several hundred feet in width, and from three or four to fifteen or twenty in depth, and occupying the lowest portion of the depression along which this ancient water course found its way. The course of this lead is extremely tortuous, and must have run through a comparatively level country. There appears to be evidences of its having met with "feeders" at various intervals along its course, coming in from the east. At the points of junction of these feeders or branches, the lead appears to be sensibly widened.

Some idea of the immense changes which the face of the country has undergone since these ancient rivers found their way along what is now the flank of the Sierra, may be inferred from the fact, that these beds have been covered up by a detritus, a large portion of which is volcanic, to a depth of nearly or quite 1,000 feet. Since that deposit was made, the present system of rivers has had its origin, passing at a greater or less angle *across* this ancient deposit, and in some localities, as near Forest Hill in Placer county, they have cut their way down through this 1,000 feet of gravel and continued on from 200 to 3,000 feet deeper still, in the hard slate below!

In our last issue we gave some account of what is doing in cement mining in and around You Bet, in Nevada county. A hasty trip into that section, last week, enables us from personal observations to fully corroborate the statements of our correspondent. Another correspondent, in our present issue, gives some description of similar mining operations at and near Smartsville, on the road about half way from Marysville to Nevada. The same class of "diggings" is found, at intervals, all the way throughout the entire extent of this immense deposit of auriferous gravel. Their importance and value can scarcely be estimated.

A SILVER MOUNTAIN CLAIM.—There is an increased movement of mining operations in Alpine county. We have lately seen rare specimens from several lodes. The most recent samples are noticed in another column. We understand that the Pennsylvania company lately struck a rich spur (leading to the main vein) which contains both gold and silver, some of the rock being judged as good as the best Comstock ore. The gold is visible in grains varying from the size of a pin head to a pea. The present season seems likely to prove up this important district.

CONTRIBUTED FOR OUR CABINET.

Under this heading we shall continue to mention and describe according to merit, such specimens of ores, minerals, fossils, curiosities, etc., as may be presented or forwarded to us by mail or express prepaid. Each article will be numbered and placed in our cabinet and recorded with the name of the donor, and the claim or location from whence it came.

M. A. WOODSIDE, of Georgetown, El Dorado county, sends us several samples of ore. No. 1 is a very interesting specimen, and most undoubtedly contains emery. It is well worth a careful analysis. The fact of its intimate association with emerylite, is, to a certain extent, presumptive evidence that it contains emery. No. 2 is a very fine specimen of emery, and fully answers the description of that mineral which we gave in our issue of April 14th. Emerylite, of itself, is most unlike emery. The first is a micaceous mineral, strongly resembling mica, foliated like that mineral, and occurs in coarse plates; the latter is an aluminous mineral, very hard, scratches quartz, is crystalized and similar in its nature to corundum, the amethyst, ruby, etc. Where it occurs massive, it is finely granulated, or semi-crystalized in structure, and in color varies from a deep to a bluish or blackish gray, and is sometimes brownish. The specimens of both minerals sent answer well the above description. No. 3 is a specimen of manganese. No. 4 is probably a hydrated silicate of alumina, containing, probably, both iron and manganese. No. 5 is a scoriaceous mineral, composed of silex and alumina. The presence of a notable quantity of the latter may be detected by wetting it with the tongue, when it will give off the strong odor peculiar to that mineral, and which is never perceived in silicious rocks.

The mineral from W. S. G., of Colusa, is evidently of a basaltic origin, and is, probably, destitute of any of the precious metals; we will, however, give it a fair test.

BUCKEYE No. 2, Silver Mountain District, Alpine county, Cal. We are indebted to Mr. D. C. Riddell for samples of ore from this company's claims, consisting of dark gray sulphurets, showing some ruby silver. Assays have been made ranging from $120 to $1,568 per ton. These claims were located in 1861. Some six weeks since the ledge was struck at a depth of about eighty feet, width five feet, dipping east at an angle of about forty-five degrees. Direction, north and south. Both walls are well defined. The company have given powers of attorney for the sale of this mine in the East, subject, however, to be revoked by telegraph. Mr. G. W. Mank is Superintendent. He is now engaged in timbering the mine, preparatory to pushing forward the work of developing the same.

ASSAY OF ORES FROM PLACER COUNTY.—The Placer *Herald* has an article on the quartz ledges in that neighborhood, and gives the results of some assays made by Mr. Treadwell, of Ophir. We copy them:

OPHIR DISTRICT.—Salmon's (now Tallmans') lead, silver, $105,60, gold, $24.11; total, $129.71 per ton.

Boulder Lead.—Croppings—gold $60, silver $11.28; total $71.28 per ton. Sulphurets from the same $1,600 per ton.

North Star.—Sulphurets—gold $2784.12, silver $197.88; total $2,985 per ton.

Peter Walter Lead.—Sulphurets—gold $1,130.12, silver $50.27; total $1,180.39 per ton. This lead has yielded rock extraordinarily rich in free gold.

AUBURN DISTRICT.—Vanderbilt Lead—Croppings—gold $60.28, silver $8.86; total $69.14 per ton.

Aspinwall.—Croppings—gold $30, silver $19,61; total $59 61 per ton. Sulphurets, gold $330, silver $62.04, total $292.04 per ton.

Great Eastern.—Croppings—gold $60, silver $18.80; total $78.80 per ton.

THE fossil remains of a gigantic bird, estimated to have stood twenty-five feet high, have been discovered in some beds of limestone at Nelson, in New Zealand. The remains consist of a head, minus the lower jaw, the dimensions of which are three feet six inches, by one foot ten inches.

UNSHED tears are better than those that fall.
How blessings brighten as they take their flight.

LIST OF OFFICERS OF CORPORATIONS AND MINING COMPANIES.

[PUBLISHED IN THE FIRST ISSUE OF EACH MONTH.]

[Below we give the date of recent meetings held in this city and the names of officers chosen or appointed. Every bona fide company is invited to send us the result of their election, to be thus put on record, gratuitously, with any other facts of general interest.]

RETURN COPPER M. Co., Andrew Valley district, El Dorado Co., Cal.—May 1st, 1866. Trustees: Jno. W. Dwinelle, E. W. Leonard, O. P. Hart, W. N. Muffley, G. M. Adams.

SOPHIA CONS. G. & S. M. Co.—Trustees: J. S. Josephi, H. Loewy, A. Unger, J. E. de la Montague, Wm Tishel. President, J. S. Josephi; Secretary, D. E. Josephi; Superintendent, F. J. Boyer.

CAPITOLA G. & S. M. Co.—April 30, 1866. Trustees: S. Peck, J. R. Hely, E. H. Swarthout, S. C. E. Thayer, C. E. Abbott. President, C. E. Abbott; Secretary, D. R. Beckford; Treasurer, E. H. Smarthout.

RECENT INCORPORATIONS.

IONE QUARTZ M. Co.—Principal place of business, San Francisco. Capital stock, $200,000, divided into 400 shares of $500 each. Trustees: Lewis Girette, George Hearst, Louis Sloss.

ASSURANCE M. Co.—Location, Monterey County, Cal. Capital stock, $144,000, divided into 1,440 shares of $100 each. Trustees: J. A. Eaton, G. R. Spinney, Wm. F. Brandreth, Wm. Lellingwell.

MAMMOTH G. M. Co.—Location, Keyesville District, Kern County, Cal. Capital stock, $240,000, divided into 24 shares of $10,000 each. Trustees: Geo. D. Roberts, Alex. W. Baldwin, and C. J. Hillyer.

NEAGLE & CORCORAN S. M. Co.—Location, Storey County, Nev. Capital stock, $200,000, divided into 2,000 shares of $100 each. Trustees: W. Neagle, Isaac E. Davis, Wm. Corcoran, and Daniel Murphy.

The State Geological Survey.

EDITOR MINING PRESS.—My attention was called to an editorial article under the above caption, which appeared in a late number of the *Alta California*, from which I quote the following extract: "The volume on geology, already published, has attracted much attention for its description of the distribution of the Jurassic, Triassic, and Cretaceous formations *under circumstances different from those observed elsewhere.*" Having attentively read the volume in question, and having failed to remark the difference alluded to in the sentence marked in italics. I am desirous of ascertaining whether any notable difference exists in the arrangement of these rocks in this State, as compared with the same series in other countries or not. Perhaps you, or some of your readers, could inform me on a point which

"I WANT TO KNOW."

Rough and Ready, May 5th.

We are not aware of any general difference in the sequence or arrangement of the above named rocks in this State, as compared with the same series in other countries. Perhaps our contemporary alluded to some minor specialty, and, in the haste of writing, made too wide a generalization.

"SECURE A HOMESTEAD" is the best advice that can possibly be given to thousands of our citizens who are possessed of moderate means, but are yet without a real *home* in this beautiful land and fruitful clime. In another portion of this paper will be observed a notice of lands and homesteads for sale by G. E. Smith, Esq., at San Leandro. Mr. Smith is a fair minded gentleman (something that cannot be said of most land operators,) and we advise those in this city and in the interior of this coast, who wish to secure a liberal homestead in a congenial climate near San Francisco, and of easy access to the city, to correspond with Mr. Smith, or take a trip some pleasant day to San Leandro. Good schools are in close proximity to these lands.

IMPORTANT MINING SUIT.—James Neall and J. R. Crandall have commenced suit against the Green Emigrant Quartz Company for $10,000, a sale of the property, and a division of the sales pro rata among the stockholders. This suit relates to the quartz ledge on Bald Hill, three miles north of Auburn, Placer county, upon which the big strike was made a year ago.

THE GREENHORN COPPER DISCOVERY.—The late discovery of copper, by Mr. Thorp, near the junction of Greenhorn creek with Bear river, is attracting considerable attention. We took occasion during our trip, last week, into Placer and Nevada counties, to pay a short visit to this mine. We found the brothers Thorp, and their partner Mr. Smith, busily engaged in sinking a shaft at the original point of discovery. The shaft had been carried down some sixteen feet, and from it had been raised some fifteen tons of ore. The yellow sulphurets were struck within two or three feet of the surface, and have continued down to the bottom of the shaft, leaving a distinct wall of good looking ore all the way down on the south side; but considerably broken up upon the north side of the shaft.

Much work will yet have to be done upon this mine to fully develop its value; although so far as opened the developments are exceedingly flattering. Yellow sulphurets are found along the line of the outcrop for the distance of a mile or more, and extension claims have been taken up for several miles.

The vein is inclosed in a heavy intrusive belt of serpentine—silicate of magnesia—which can be traced for many miles across the country north and south, having an apparent breadth of about half or three-quarters of a mile, and gradually changing on the east and west to chloritic, and argillaceous and silicious slates. Active operations are in progress for the development of the mine, and fifty or a hundred tons of ore will soon be delivered in this city, when it will be sampled and arranged, from the results of which we shall probably be able to speak more particularly with regard to the value of the mine.

New Mining Laws of California and Nevada.

We have just issued, in cheap edition, the new laws relating to mining and corporations in California and Nevada, passed in 1865–6. Some of these laws are of the highest importance to parties interested in the matter of locating and holding claims, and prospecting mines, in these States. Copies sent by mail. Price, 25 cents.

Address, DEWEY & Co., Patent Agents.
San Francisco, May 1st, 1866.

Judicious Resolutions.

Several of our most substantial and judiciously managed mining corporations have passed resolutions, since the approval of the new assessment law, requiring all notice of assessments and sales to be published in the MINING AND SCIENTIFIC PRESS, the only thorough (daily or weekly) mining journal on this coast. Our efforts to concentrate all mining advertisements in one paper, for the economical convenience of shareholders and assessment payers, are meeting with decided success. Those who believe in supporting the mining cause, should bear our paper in mind, and bring up this subject at the next trustee or shareholders' meeting.

San Francisco, April 7th, 1866.

Look Out for Illegal Advertising!

All assessments of corporations levied on, or subsequent to, March 26th, are governed by the new law approved on that day. We notice that some of our important mining companies are advertising their assessments illegally in the daily and weekly press of this State. As the new law is more liberal in its provisions for advertising than the Act of 1864, these companies have yet time to retrace their steps and begin anew and right. We speak of the matter for the benefit of all concerned. We have prepared a set of correct blank forms for advertising assessments, which we furnish free on application at our office, together with rules for advertising and copies of the new law.

A PRETTY CUSTOM.—One of the prettiest of Christmas customs is the Norwegian practice of giving on Christmas day a dinner to the birds. On Christmas morning, every gable, gateway and barn-door, is decorated with a sheaf of corn fixed on the top of a long pole, wherefrom it is intended that the birds shall make their Christmas dinner. Even the peasants will contrive to have a bandful set by for this purpose; and what the birds do not eat on Christmas day remains for them to finish at their leisure through the winter.

THE ÆTNA IRON WORKS.—This new foundry and machine works establishment lit its fires for the first time on Thursday last, and turned out quite a nice lot of castings. The company is composed of several of our most enterprising mechanics, who have hitherto been connected in various capacities with different foundry establishments in the city. There was quite a gathering of the friends of the new firm on the occasion, and the hand of fellowship was most cordially extended by their fellow mechanics. May the fullest measure of success attend them in their new enterprise.

WORDS FOR MINERS.—The Gold Hill *Daily News*, Nevada—a medium of good authority—saith thus:

The MINING AND SCIENTIFIC PRESS is a weekly journal, published in San Francisco, which is entitled to the subscription patronage of every practical miner in Nevada, and every person interested in Nevada or California mining operations. It is a well gotten up sixteen-page quarto; and its reading would lend vastly to the particular "posting" and general enlightenment of our sort of working folks. Subscribe for it. Five dollars a year; three dollars for six months. It should have an agency in Virginia and Gold Hill; but we see none advertised in its columns. Every new improvement in mining implements and operations are fully described by words and illustrated by wood cuts in this excellent publication. A specimen number can be seen at our office.

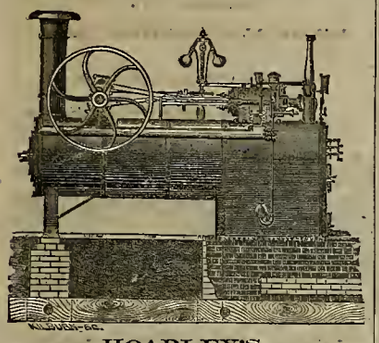
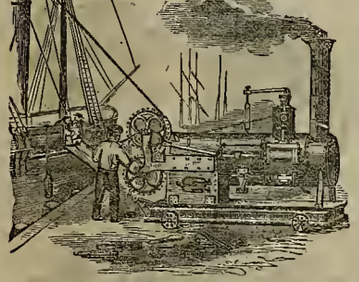
Portable Steam Engines!

"Hoadley's" and "Hittinger's" Make,

HOADLEY'S.
FOUR SIZES,
8, 10, 12, and 15-Horse Power,



HOADLEY'S.
3 to 40-Horse Power.



HITTINGER'S.
THREE SIZES,
5, 7, and 10-Horse Power,

HITTINGER'S.
TWO SIZES,
5 and 7-Horse Power,

COMBINING THE MAXIMUM OF EFFICIENCY, DURability, and Economy, with the Minimum of weight and price.

These Engines are favorably known, a large number being in use on this coast for hoisting, pumping, threshing, milling and mining purposes.

Steam can be got up on these Engines in fifteen minutes after reaching the place of operation, and the time, expense of setting boilers, machinery, and "construction account" saved, (which is often the difference between the successful and unsuccessful prosecution of milling enterprises,) in fact, the portable principle is the pioneer's friend, and enables him to draw engines on their own wheels to his cabin door, and plant on the outermost confines of civilization the saw and grist mill, and it has done and will do more to help subdue the continent than any other of the modern motors which are crowding society and normalizing the world.

All sizes on hand from 3 to 30 horse power, with and without carriages.

Also, Portable Saw and Grist Mills.

[Written for the Mining and Scientific Press.]

Auriferous Gravel Deposits.

MESSRS. EDITORS: While you are publishing much valuable information, regarding the more novel or attractive business of quartz mining, allow me to give your readers a few words concerning the gravel diggings of Yuba county, which may be considered as more or less representative of an important branch of mining in many other localities.

Eighteen miles northeast of Marysville, and one from Timbuctoo, at Smartsville, is located some of the best paying placer mines in the State. The mines are all gravel diggings, no quartz being yet found in the vicinity worth prospecting. So valuable are the mines now in operation, that all the attention is turned toward them, and all the interest is centered on the development of new mines of the same character. The rich pay dirt seems to extend through the center of a series of hills, a distance of a mile or more from point to point; lying along the bed of an ancient river, whose level line has probably been filled in by some great geological change. The local *savants* have passed their opinions as to probable causes for the deposits and formation, leaving the unbeliever to study out the evidence to the contrary for himself. There can be no doubt that the present mines occupy the bed of what was once a river, and that the rich deposits of gold are the result of years of washings from the surrounding hills and mountains, the gold being formed into, and held in the great natural sluice formed by the river bed. Every indication of the action of water, such as beds of pure sand in layers; conglomerate sand and gravel; smoothly washed boulders; deep washed lines in the bed rock; also immense quantities of vegetable matter in various stages of petrifaction are here, indisputable proofs of the early conditions of the present mine.

There is considerable irregularity in the general aspects, yet there seems to have been three different deposits of matter, all differing essentially from each other. The first is at the lowest point next to the bed rock, and consists of immense beds of conglomerates, made up of coarse gray sand and ordinary cobble stones. This contains the greatest quantity of gold, hardly a stone being displaced without showing the color. Next in the ascending series comes the blue gravel in great quantities, and very rich also in deposits of gold. This formation in quantity far exceeds the first named, and is the principal supply for the sluices. The third is the surface, also conglomerate of sand and gravel. It is red and rather badly decomposed, being easily broken in the fingers. This formation contains the color, but falls far short of the yield of the other two. This, with a large supply of water and ground would pay well for trouble and expense. The miners here do not take much pains with the surface, they simply crush enough from it to pay for the removal of the dirt in their descent to the lower and richer beds.

As the operations are the same in the various mines, a simple notice of one of the principal ones will give the reader a sufficient idea of the workings of all. The oldest and most valuable mine here is the Blue Gravel claim. This occupies the center of one of the hills, and is evidently in the center of the old river bed. It contains all three formations in almost inexhaustible quantity, as the level of operations descends, the results increase. Not only does it show more dirt, but also increased richness. From the top of the hill, to the lowest level, in a straight line, would measure several hundred feet, and so immense is the quantity of gravel that it promises to last for years to come, notwithstanding the vast amount daily washed off by the hydraulics and sluices.

The observer, for the first time, is struck with astonishment at the great amount of labor expended on this mine, to develop it to the paying point, and can hardly believe the evidence of his own senses, when he sees a vast hill center burrowed out, and millions of tons of earth removed in so short a time, (The working of this mine commenced in 1855). His idea of the force of water is made more comprehensive, when by a moment's watching he sees tons washed away while he expresses his astonishment. The present level of the mine some hundred feet below the surface line, was opened a few years ago by a tunnel, a half mile in length. Through this tunnel a flume has been constructed, running to the Yuba river a mile distant, through which all the dirt passes to the dump. This tunnel is a fine piece of work and shows what labor, when well directed, will accomplish. The timbering is

substantial, supports being placed only one foot apart. Throughout the entire length, the tunnel is cut through hard bed rock, and cost an immense amount of labor, time and money. It has been found necessary to open the mine still lower, and a new tunnel has been commenced sixty feet below the present one. The hydraulic power is well understood and applied at this mine. At one bank we noticed five pipes, with 3½ inch nozzles, playing at once. So great was their concentrated power, that huge stones were overturned, and twisted about as if they were chips.

As "the eating is the proof of the pudding," so is the yield of gold the proof of a mine, and in this direction we are not fearful of much criticism. The runs average thirty-five days, and each clean up generally amounts from $40,000 to $50,000. The last amounted to about $59,000, which would bring in a large yearly income to the owners. There are only 200 shares in this mine, and they are held by four persons: Mr. J. P. Pierce and A. L. Morrison of San Francisco, Mr. H. B. Simpson and D. McGanna of Smartsville. At one time there were a larger quantity of shares and number of shareholders, but discouragements on the part of some, and hopefulness on part of the others, concentrated the interests and reduced the owners to the present number. Not a great while ago, one owner's interest was sold for $1,100, the same now would bring five times that many thousand. The present condition of the mine dates from 1863, leaving all the years back to 1855, years of toil and struggle, with almost hopeless prospects at times, but success has blessed their labor and wealth flows into the owners' coffers in a steady stream of gold. W.

Wine, Cider, Cotton and Tobacco Presses of the latest Improved Patterns.

Brodie's Improved Patent WIND BLAST SEPARATOR, for Dry Crushing; Baux & Guiod's Amalgamator and Separator; Coal Oil Well Boring Machinery complete, on hand.

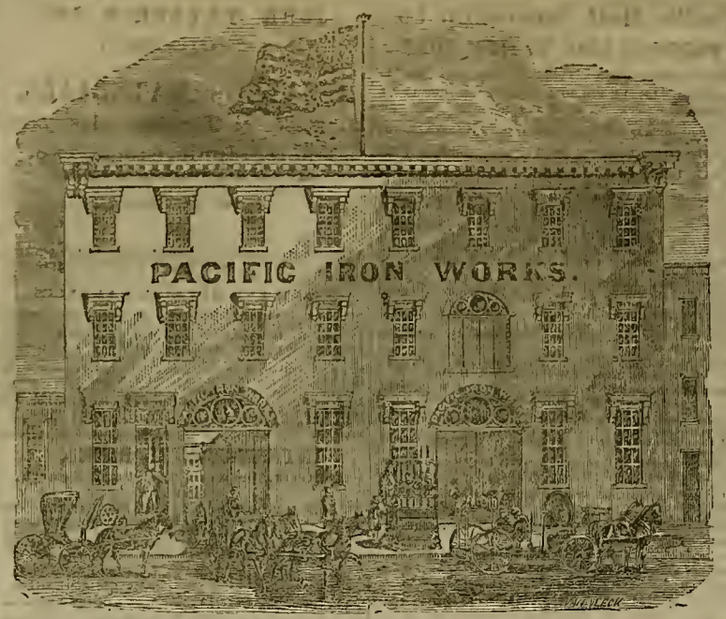
STEAM ENGINES AND BOILERS,

Of all sizes, constantly on hand; Quartz Mill Shoes and Dies warranted to be made of the best white iron.

Dunbar's Improved Self-Adjusting Piston-Packing, requires no springs or screws; is always steam-tight; without excessive friction, and never gets slack or leaky.

MACHINERY, OF ALL DESCRIPTIONS, Bought, sold, or exchanged. Bolt Cutting and Castings at the lowest market rates.

6v11-1y DEVOE, DINSMORE & CO



THE PACIFIC IRON WORKS,

First & Fremont Sts., between Mission & Howard, San Francisco.

The proprietors of the above Works invite the attention of all parties interested to their greatly improved and unequaled facilities for manufacturing Steam Engines and Boilers, both Marine and Stationary, of any required size and pattern, Quartz Mills, Amalgamating, Pumping and Hoisting Machinery of the most approved construction. Flour, Saw, and Sugar Mills, Water Wheels, &c., &c. Our pattern list is most complete and extensive, embracing the late improvements in all classes of machinery adapted to use on this coast. We would call especial attention to the fact that we have secured the exclusive right of manufacture for the Pacific Coast of the celebrated Greene Engine, conceded to be the most economical and perfect working Engine now in use. We are also exclusive manufacturers of the celebrated

Bryan Battery, Varney's Amalgamators and Separators, Ryerson's Superheated Steam Amalgamators and Rotary Crushers, Stone Breakers, &c. Orders respectfully Solicited.

GODDARD & COMPANY.

REMINGTONS'

ARMY AND NAVY REVOLVER,

THE REMINGTON REVOLVER

Has been approved by the United States Board of Ordnance, and has so satisfactorily met the requirements of the Government, not only in the field, but in the official tests and examinations made by prominent officers of the Ordnance Department, that it stands at once the most popular, serviceable and approved arm of the kind in use. Upwards of 125,000 have been supplied to the Government within the past four years, for the land and naval service, furnishing ample evidence of the estimation in which the arms are held.

Simple and symmetrical in its entire construction, securely strong, of most modern improvement in mechanism and material; its unequaled range and penetration together with its durability, are points in its favor now well known, and which challenge a comparison with any other pistol of the kind made in this country or in Europe.

The superior strength and capacity of the arm for constant and long use is apparent from the fact that the entire frame is constructed of a single piece of metal, thus preventing the extension of some portions of the frame, from the effect of firing—a serious defect in many pistols—in which the frame is composed of two or more parts.

The frame of the Remington Revolver furnishing a TOP STRAP or support above the cylinder, served to protect the base pin (on which the cylinder revolves) from any undue strain to which it would otherwise be subjected, and which would immediately render the fire of fire from the cylinder to the barrel imperfect, thus destroying force and accuracy.

Another advantageous feature of the arm is the means afforded for the instantaneous removal of the cylinder from the frame. This not only facilitates the cleaning of the pistol, but by the quick adjustment of the cylinder, one pistol can be made as effectual as two—and, considering the difference of weight, it is far preferable—by simply possessing a spare cylinder loaded and capped to instantly replace the exhausted one.

The above is a general summary of the points of peculiar merit in the Remington Revolver which a trial of the arm is only needed to attest. For sale at Manufacturers' rates, by

16v12 ALBERT E. CRANE, Manufacturers' Agent, 310 Washington Street, up stairs.

Vulcan Iron Works Company

[ESTABLISHED 1850.]

First, Natoma and Fremont Streets.

IRON FOUNDERS,

Steam Engine and Locomotive BUILDERS,

Boiler Makers, and Workers in Sheet Iron, Brass and Copper.

These Works have lately been increased by the addition of new shops on Fremont Street, doubling the capacity of the original establishment. Their facilities for turning out machinery promptly and efficiently, are now unequaled in the State. Their Boiler Works have also been enlarged correspondingly.

The Company are prepared to execute orders for all classes of Machinery and Boiler Work, such as

Mining, Steamship, and Steamboat Machinery,

Railroad Machinery, Locomotives, Car Trucks, Car Wheels, Housings and Irons; and Flouring Mills, Quartz Mills, Sugar Mills, Saw Mills,

Manufacturing Machinery of Every Kind.

Sole Manufacturers of

HEPBURN & PETERSON'S REDUCING PAN AND AMALGAMATOR

BEATH'S AMALGAMATOR;

HESSE & MOORE'S IMPROVED HOWELL QUARTZ CRUSHER;

BAUX & GUIOD'S AMALGAMATOR AND SEPARATOR;

FAUCHERY'S QUARTZ GRINDER AND WATER WHEEL;

JONVAL'S IMPROVED WATER WHEEL;

LEFFEL'S AMERICAN DOUBLE TURBINE WATER WHEELS.

STEVEN'S PISTON PACKING RINGS.

They have also a large assortment of Patterns for Pumping and Hoisting Machinery, Gearing, Pulleys, Water Mill Irons, Hydraulic and Screw Presses, Retorts, Furnaces, Grate Bars, House Fronts, Ornamental Fence Posts and Paling, Stove Ranges, etc., etc.

Quartz Stampers, Shoes and Dies, of the best Hard Iron. Quartz Screens of Russia Iron Punched to Order. 27

UNION IRON WORKS!

Corner First and Mission streets,

SAN FRANCISCO.

ESTABLISHED IN 1849.

HAVING INCREASED OUR FACILITIES IN EVERY Department, we are now prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps of all kinds, Hoisting Gear, Gas Work, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic, Hay, Rag, Screw and Drop Presses, Coining Machinery, Pile Drivers, Bark and Malt Mills, and all kinds of Castings.

Engines.

Marine Engines, Oscillating and Beam; Stern and Side Wheel Boats, Locomotives, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott and Eckart's Adjustable Cut off Regulator—best in use; W. R. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pump and Fire Engine.

Boilers.

Locomotive, Flue, Tubular, Upright, Cylinder and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.

Amalgamating Machinery.

Wheeler & Randall's improved Tractory Curve Pan, Zenas Wheeler's improved flat bottom pan, Beldin's pan, Venteh's tubs, Prater's concentrators, Wakiee's pans, Beers' pan, German Barrels, Arastra Gearing, Chile Mills, Settlers of all descriptions, Retorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Cams, Pans and Tubs.

BLAKE'S PATENT QUARTZ CRUSHERS, of all sizes.

Oil Boring Tools and Machinery,

Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania.

We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.

Russia Iron Screens, of all degrees of fineness and of all qualities of iron.

All work done in the best manner at the lowest cash prices.

1866 JANUARY 1st, 1866

Commencement of Twelfth Volume

—OF THE—

Mining and Scientific Press

Published Every Saturday.

The title of our journal is a truthful expression of its character.

It affords a class of progressive information to the Miners, Mechanics and Professional Men of the Pacific Coast, which cannot be derived from books, or other publications.

Each Volume comprises, in reality, a book of new intelligence and facts relating to Mining, Mechanism, Metallurgy, Science and Art, developed by our rich and peculiar resources, and identical with our own industry and history.

By the encouragement of intelligent economy in LABOR and GOLD-SAVING, we shall make the PRESS a source of INDIVIDUAL PROFIT to its patrons, as well as a public benefit to every local community in which it circulates.

The prospects of our journal are now brighter than at any former period. Our facilities for furnishing a valuable paper are constantly increasing.

Following are some of the many opinions generously expressed by our neighbors:

Editorial Expressions:

We can give our testimony that it is always replete with useful and valuable information to miners and mechanics. [Placer Herald.

The publishers intend to make it the "Scientific American" of the Pacific Coast. Every miner should have a copy of it in his cabin, for it will be filled with useful information to the pick and shovel fraternity.—[Trinity Journal.

It contains correspondence from different sections, giving accounts of new discoveries in gold, silver and copper, and should be taken by every person that wishes to keep well posted on the developments of our State and the Territories.—[Mountain Messenger.

With the last number is an index to the whole volume, most useful and valuable to those who keep files of that paper.—[Shasta Courier.

Prof. J. D. Whitney's address on Mining, is given entire. * * * We preserve the PRESS, and would like to have a full file.—[Napa Reporter.

The public should support the enterprise of the MINING PRESS, one of the best papers in the State, by a liberal patronage, as it is only by a system of legitimate reports that our mines can be favorably brought before men of capital below.—[Calaveras Chronicle.

Under the management of Messrs. Dewey & Co., the PRESS has been much improved in every respect. * * It deserves a liberal support.—[Virginia Union.

A good paper for this country.—[Humboldt Register Na.

Those who would have a good paper of this character should subscribe now.—[Marysville Appeal.

It embraces one of the finest fields in the world, and seems to improve it. * * * It will be second to no scientific record now published on this continent.—[Los Angeles News.

A neat and useful journal. One of the most prescutable and useful in the State.—[Sunday Mercury.

Such a journal has been needed on the Pacific Coast. The PRESS fills the bill.—[Reese River Reveille.

A splendid paper, and should have a good list of subscribers in prosperous Grass Valley.—[G. V. National.

We receive, regularly as clock work, this exceedingly valuable and interesting journal.—[Napa Reporter.

Interesting and important to miners and Mountain men. [Butte Record.

Friends pleased with our efforts in the publication of the PRESS can render us essential aid by furnishing correspondence and all important information which may come under their observation, and by calling the attention of their neighbors to the commendable features of the paper; the appreciation of which favors will be duly manifested by the constant improvement of our journal.

Specimen copies will be sent free to those desiring to examine the paper before subscribing. Postmasters, Express Agents and News-dealers, acting as our agents, will receive liberal commissions.

SUBSCRIPTION IN ADVANCE.

QUARTZ OPERATOR'S HAND BOOK

A Book for Every Intelligent Prospector, Shareholder, Miner and Machinist.

ZENAS WHEELER AND P. M. RANDALL,

Authors and Publishers.

BOUND IN CLOTH—144 PAGES, DUODECIMO.

THE QUARTZ OPERATOR'S HAND BOOK is presented to the public as a carefully prepared epitome of all that is valuable for the practical operator in the mine and mill. We have here all the most necessary hints and directions for testing and assaying the ores of the various minerals; an explanation of chemical terms; a brief and intelligible description of the numerous processes for roasting ores, and the extraction of metals from their ores by amalgamation and otherwise.

The work also contains an original and highly interesting discussion of the tractory and differently formed grinding plates, as applied to the reduction of ores—a subject not only of special interest to the scientific reader, but also practically of the highest importance to every quartz miner.

Professor Silliman, of Yale, and Hodgson, of the College of California, having examined this discussion, as submitted to them by its author, Mr. Randall, previous to the compilation of this work, speak of the same as not only mathematically correct, but also as of great practical value. Messrs W. R. Eckart, Jr., Engineer, (late of U. S. N.,) and W. M. Belshaw, assayer and superintendent of the S. T. M. Co., to whom the entire work was submitted while passing through the press, speak of the same as one of high practical importance to quartz miners and millmen generally.

No work has been offered to the mining public of California which contains so much valuable information, condensed into so convenient a space as is here presented. In its preparation, much care has been taken to secure brevity, concisenss, and simplicity—in fact to make it a complete and reliable QUARTZ MINER'S HAND BOOK.

The Table of Contents of this book will be found on page 415 of the MINING AND SCIENTIFIC PRESS of July 1st, 1865.

Sold by booksellers generally. Price by mail, postage paid, $1.25. Address "Wheeler & Randall, at the Mining and Scientific Press Office, San Francisco." 2v11

New Mining Advertisements.

Continued Mining Advertisements will be found on another page.

Gold Hill Tunneling Gold and Silver Mining Company.—Location: Gold Hill Mining District, County of Storey, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 10th day of May, 1866, an assessment (No. 7) of one dollar per share was levied upon the capital stock of said company, payable immediately in United States gold coin, to the Secretary, R. Wegener, 415 Montgomery street, San Francisco, California, or to the Superintendent, Mr. F. Chappellet, Gold Hill, Nevada.

Any stock upon which said assessment shall remain unpaid on the 15th day of June, 1866, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the 10th day of July, 1866, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

R. WEGENER, Secretary.

Office, 415 Montgomery street, San Francisco, Cal.

A discount of three (3) per cent. will be allowed on all payments made on the above assessment on or before Monday, the 21st day of May, 1866. By order of the Board of Trustees.

my12 R. WEGENER, Secretary.

Kentucky Copper Mining Company, Mine Felix District, Calaveras County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the 2d day of April, 1866, the several amounts set opposite the names of the respective shareholders, as follows:

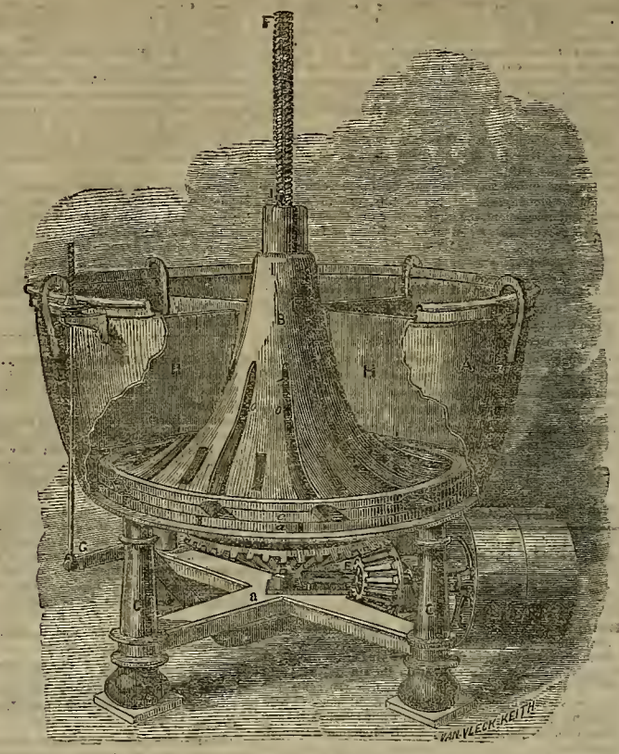
Delays are Dangerous.—Inventors on the Pacific Coast should bear in mind that by patronizing our Patent Agency they can sign all necessary papers for securing patents almost immediately, thereby avoiding the three month's delay requisite in transacting business through Eastern agencies.

Money by Mail.—Subscribers and advertisers remitting us money in less sums than $50, can do so by mail at our risk, if they will register their letters; we will take no risk on unregistered letters, or letters by express. Remittances by express must be prepaid.

THE EXCELSIOR
GRINDER AND AMALGAMATOR.

In the engraving herewith presented, A represents the Rim of the Pan; B, Muller; C, Legs; D, Cross-Frame; E, Gearing; F, Screw; G, Lever; H, Dash-Boards; I, Key; *a*, Dies; *c*, Shoes, and *o*, Openings,



The relative grinding capacities of "The Excelsior" Grinder and Amalgamator, of the Flat Bottomed Pan, and of the Conical Pan *when properly constructed*, are respectively 177, 98 and 110.

That is, the respective mullers being of the same diameter, same weight, same hardness, and running at the same velocity "The Excelsior Grinder and Amalgamator" will reduce one hundred and seventy-seven tons of ore, the Flat Bottomed Pan ninety-eight tons, and the Conical Pan one hundred and ten tons to the same degree of fineness in the same time.

The wear to the Shoes and Dies at their grinding surfaces in the Excelsior Grinder and Amalgamator, is perfectly uniform, thus securing evenness of reduction to the pulp, as well as steadiness of motion to the muller. Uniform wear of the grinding plates has been attained in no other than that of the Tractory form—nor can it be.

Another property of excellence in this machine is that the metal or substance to be amalgamated passes *direct* from the grinding surfaces into the quicksilver; thus excluding the possibility of its becoming coated with any foreign substances, after having been burnished. It is truthfully said "that the Tractory-formed Pan as a Grinder has no equal, and as an Amalgamator no superior."

As a whole, it is far superior to any other pan in use.

WHEELER & RANDALL, Inventors.

The undersigned having had several years of experience in practical quartz mining operations, will ever take great pleasure in furnishing parties interested in mining and machinery any desired information which they may possess.

[Written for the Mining and Scientific Press.]

From El Dorado County.

BY OUR TRAVELING CORRESPONDENT.

Messrs. Editors: After leaving Placerville, the county seat and center of the great mineral belt of El Dorado, I first visited the mills and the mines, situated on a series of parallel lodes to the south, believed by many, from the striking similarity in the quartz and other characteristics, to be on a range with the celebrated Eureka mine of Amador; some of the veins giving marked evidence, both on the surface and at the greatest depths attained, of being at least as highly auriferous, with many signs of permanence.

The first in this direction was

THE MITCHELL,

Owned by Capt. J. D. Woodworth & Co., two miles south of Placerville and one east of Diamond Springs. The lode commences on the surface with a width of eighteen inches, and at the bottom of a shaft seventy-five feet deep, has gradually grown to four and a half feet, and even from wall to wall. An incline is now under way to strike the vein forty feet below water level and 250 feet beneath the surface of the over-lying mountain. This location is one of the oldest in this part of the county, and is said to have averaged at one time about $85 per ton of quartz, which is considerably impregnated with pyrites and streaked with seams of black shale, showing free gold at every degree of depth attained. The work is now being pushed forward with energy and determination under the charge of Capt. Woodworth, who informed me that a 20-stamp mill had been ordered for the mine.

Such are the prospects, that many locations have been made on the extensions or on parallel lodes, some of which are worked with vigor, and although giving excellent indications, we are compelled to pass with a mere allusion.

The next in order on the line of the supposed mother vein, deemed worthy of a special notice, is

THE ROGERS,

Not so much from the amount of work in the way of development, as from the character of the quartz and other marks, indicative of a permanent and valuable mine. It is two miles southerly from Diamond Springs and one north of the Union mill, and has been opened at several points along its entire length of 3,000 feet, showing a well-defined lode at the depth of fourteen feet, from three to four feet in width, with a gouge of decomposed shale on the foot wall, the east or hanging wall being of greenstone. The quartz is what is here denominated the ribbon species, from the dark colored seams that run in horizontal layers through it, occasionally assuming the form of parallel waves. Little or no free gold can be seen with the eye, but the rock works about $9 per ton in the arastra, built on the claim, exclusive of what is contained in the sulphurets which are worth $200 and upwards per ton. As it takes about twenty tons of the quartz to produce one ton of the sulphurets, it has been calculated, there will be a return from both sources of from $18 to $20 per ton, which will afford a handsome interest on the amount invested. Messrs. DeWolf and Baker, of the village of El Dorado, having recently purchased the remaining interests, are now the sole owners, and are determined to carry forward the work without delay, encouraged not only by the success of the past, the claim being self-sustaining, but rendered hopeful for the future in view of the many indications of permanence in the character of their lode, as well as by the strong probabilities of a gradual increase in the value of its ores in the progress of development.

THE SPANISH,

A quarter of a mile east, encased in slate, is owned chiefly by these same gentlemen. The vein averages two and a half feet in thickness and contains much free gold; in certain portions being exceedingly prolific, 500 lbs. of ore assorted, yielding at the rate of $4,000 to the ton. Such has been its richness, that its

HUNTER'S

Premium Cnocentrator!!

Awarded a Silver Medal at the Mechanics' Fair of 1865.

THE ABOVE MACHINE HAS BEEN RECENTLY IMproved and simplified, doing away with all complication and friction, thereby requiring less power and speed. As improved, 125 revolutions per minute is the regular speed required, but any speed varying from 100 to 135 revolutions does not change the results. It is the only machine built on the Pacific coast that is perfectly adjustable for all the different grades of ores, and will save ten per cent. more sulphurets than any Concentrator in use, and is the cheapest, from the following list of prices:

For a single machine of the capacity of five tons in twenty-four hours, as it passes from the battery or pans, $125. For double machines of two, three, or four tables in one frame, each table of five tons capacity, $100.

I have been running machines for the past three months at Grass Valley, therefore I make my assertions from a practical working test, where several of the machines are working. Persons desirous of seeing the machines running, can do so at Empire Mill, Grass Valley, where twelve machines can be seen in operation, or in San Francisco, at 118 Washington street, below Davis, where Alsear Jacobs will fill their orders promptly.

LEFFEL'S

American Double Turbine

WATER WHEEL.

THIS WHEEL, WHICH HAS HAD THE most unprecedented sale of any water-wheel ever made, and which has given unusual satisfaction wherever used, is now for sale by KNAPP & GRANT, 310 Washington street, San Francisco, where persons desiring to use water-power can be supplied. These Wheels are adapted to use from 10 to 5,000 inches of water, and from 4 feet to 500 feet fall. Let us know how much water you have either in miner's inches or cubic feet per minute, what fall you have, and what power you require. Write or send for circular to

KNAPP & GRANT,
—ALSO—
San Francisco.

Leffel's Lever Jacks,

For railroads, cars, or wagons; Railroad Jacks for engines and cars; Track Jacks for leveling, with which three men, with a pair of these Jacks, can level more track in a day than twelve men working in the ordinary manner; also, Track Jacks, for relieving the axle of pressure to replace the brass. These Jacks are now in general use in the Eastern States, and give entire satisfaction. Also, Wagon and Track Jacks of the most superior make and kind.

For sale by KNAPP & GRANT,
12v12-3m San Francisco.

"Safety Cages."

(PATENT GRANTED.)

MINING COMPANIES

WILL FIND IT TO THEIR INTEREST TO ADOPT "Berry, Hochholzer & Denver's Safety Cage" in their hoisting works. It requires very little more work to manufacture than the ordinary style of cages—any blacksmith can make it. It has been PROVED TO BE PERFECTLY SAFE, is self-acting and very light, and will, in the item of rope alone, pay for itself in a short time.

The proprietors refer to the following mining companies, among others, that are now using this Safety Cage:—Gould & Curry, Savage, Ophir, Mexican, Empire, Overman and Justis.

For particulars and terms, apply to

HUGO HOCHHOLZER,
Virginia City, Nevada.
15v11tf Through Wells, Fargo & Co's Express.

entire length near the surface, has been worked off by the Spaniards of the neighborhood, and like the preceding claim, has thus far paid all expenses incurrent in sinking and tunneling, —no bad indications of a good mine.

The next claim appearing on the line of this range, is that of

THE CHURCH UNION GOLD COMPANY,

About three miles from El Dorado, and six from Placerville, where, as also throughout the county, it stands in good repute, and consists of two principal lodes, the Union and the Cosumnes, which probably intersect somewhere near their present works, and contain in the aggregate about 7,405 feet. A new engine of 30-horse power has been ordered for the purpose of sinking a perpendicular shaft at their point of intersection, whence drifts can be run in all directions upon the different veins, through which an immense amount of ore can be hoisted with little labor and comparatively small cost. The company own in the neighborhood of the mine 360 acres of wood land, and have erected a large boarding house, blacksmith shop and one of the most finished mills on the coast, together with a 45-horse engine of 12-inch bore and 24-inch stroke, saying nothing of pans and concentrators. The mill of twenty stamps, 650 lbs. each, and the whole machinery attached, were built at the Vulcan Iron Works in San Francisco, under the immediate supervision of Mr. J. T. Babcock, a practical machinist and experienced miner, and who at the same time having seen service in the mint, must be admirably fitted for the position he now fills as superintendent. Some of the internal arrangements about the mill, which are his, in plan as well as in execution, appear worthy of notice from their simplicity and convenience. A platform surmounted by steps encircles the battery at an elevation of ten feet from the ground floor, and nearly opposite the cams, from which the whole of the works can be very conveniently overlooked or superintended; the stamps, also, by a very simple arrangement, being instantly and simultaneously put into gear and as readily thrown out, by means of a lever connected with certain little props which rest with one end on the platform, and the other against the cams. For amalgamating inside the batteries, copper plates are used four feet by six inches, and are set at a particular given angle, found by the superintendent to be the best possible for the greatest percentage of gold.

The pulp is discharged from the batteries through a perforated screen of Russian iron, containing 250 holes to the square inch, and then passes over three step copper plates, four feet two inches by seven inches. It thence falls from the screen in the form of a shower into a box of mercury, seven inches square by nine in depth, containing about thirteen pounds of the quicksilver and filling it to the hight of one inch, on a level with the discharge, which runs directly through copper plated troughs into the concentrators. This mercurial bath, as it is here called, while its cost is almost literally nothing, has worked very successfully and is looked upon as another step in the way of progress.

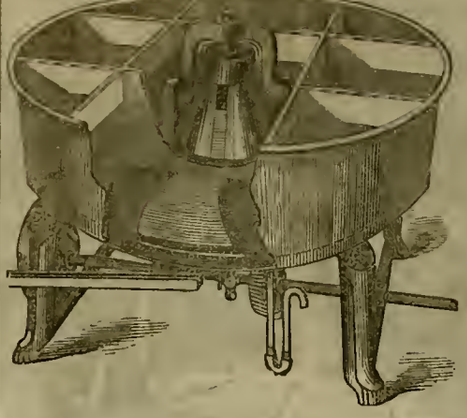
Mr. Jessup, the agent and correspondent of the company, informed me that the superintendent had also been very successful in the use of sodium in amalgamating, not only within the batteries, but also elsewhere whenever used, both of whom testified in its favor and took the greatest possible pains to point out to me its advantages, as well as to explain the minutest particulars in regard to the various machinery, even to the details of their operations. We close our description of this mine by a brief notice of the two principal veins. The Union varies much in thickness, having an average of perhaps eight feet, and a shaft upon it of about 200 feet. The quartz contains a good deal of free gold, and is interspersed liberally with the small black sulphuret of iron. The Cosumnes is considerably smaller than the other but far more uniform, and has a layer of black clay as a "gouge" on the hanging-wall. The veinstone shows less free gold and fewer sulphurets, and is said by Prof. Silliman to have "a remarkable resemblance to the well known Princeton vein," both as to appearance and contents, the quartz being more streaked than that of the Union with seams of black shale, while the walls of each, as you may have inferred, are of black slate. More need not be added in regard to a mine from which several fortunes have been already realized, having yielded since its location not less than $1,000,000. In 1864 Prof. Silliman made an examination of it, and also a report, whereupon it was purchased by his brother-in-law, Mr. Church, the president of the company, and other New York capitalists, and incorporated with a capital of $1,200,000, $200,000 of the stock being appropriated as a working capital and consequently leaving the shares free from assessments. PROSPECTOR.

[Concluded next week.]

A SCHOOL for colored children has been opened at Red Bluff. Miss Sarah Brown, daughter of John Brown, is teacher.

Knox's Improved Patent Amalgamator and Separator,

With Palmer's Patent Steam Chamber or Die.



THIS CUT REPRESENTS AN AMALgamator and Separator that has stood the test of EIGHT YEARS' practical working in the gold mines of California, and for nearly the same time in the silver mines of Nevada, having been introduced into the first steam mills built in the then Territory, since which time they have been successfully working against all competition.

The great advantages these Amalgamators have over any others, are—

1st. **Much less Cost.**

2d. They do not "flour" the mercury, and collect any that may have been "sickened" in the battery or grinders.

3d. The "sloshing" motion given to the pulp (by the revolution of the muller under the stationary frame) against the amalgamated copper plates that are fastened to the frame, and by this means catching the fine gold and mercury that will not settle.

4th. The gate in the cone, through which the pulp is discharged, from the top, and where there is the least motion, almost precluding the possibility of any granulated mercury or fine gold escaping.

There are over 500 of them in use in California and Nevada, where those interested can see their practical workings.

☞ For further particulars, inquire of ISRAEL W. KNOX, OR W. A. PALMER, Inventors,

14v13-p12q At the Golden State Iron Works, No. 19 First street, San Francisco.

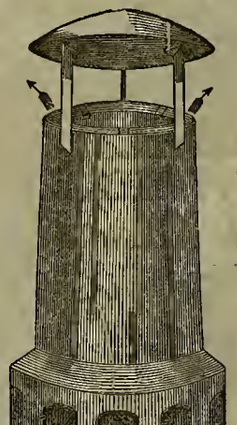
A RARE CHANCE FOR INVESTMENT.

THE PATENT RIGHT FOR SALE FOR STATES, TOWNS AND COUNTIES.



For the Best Chimney Top

Ever invented. Numerous testimonials from Proprietors of Factories, Foundries, Steamers, Hotels, etc., can be shown, attesting to its usefulness in creating draft, saving the expense of high chimneys, and a great saving of fuel.

Pamphlets containing descriptive drawings and testimonials will be sent free, upon application by letter or otherwise to the patentee, B. A. HENRIKSEN,

Or J. E. JOERGENSEN,

12v12-3m No. 328 Kearny street, San Francisco.

Union Amalgamator.

This Valuable Invention

IS FAST FINDING ITS WAY INTO GENERAL USE, NOT by means of combination of capital and influence, but on the strength of its own merits, and upon the principle that what is known to be good will be appreciated. Practical men acknowledge the UNION PAN to be scientific, the best, the cheapest, and most profitable. It now stands first on the list of all pans in use for the purpose of

Working Gold and Silver Ores.

It has been found that a low class of ores, also tailings from Mills, Sulphurets, etc., that will not pay to work with the common pans, may be worked with this and obtain large profits. The UNION PAN is manufactured in two sizes, and capable of operating upon large quantities of ore in the most efficient manner.

Parties interested in Quartz Mining, Mills, etc., will find it to their advantage to call and examine for themselves, and see its operation.

Gold and silver ores tested by regular mill process, at moderate cost, by STRONG & CO.,

San Francisco Foundry, corner Mission and Fremont streets, where orders will receive prompt attention.

15v12-3m

BAUX & GUIOD S

Separator & Amalgamator

Is the most important improvement in mining machinery ever introduced. It was awarded the FIRST PREMIUM at the San Francisco Mechanics' Fair for 1864, where it proved itself to be the best Separator and Amalgamator among all the competitors. Constructed on principles which combine SCIENTIFIC KNOWLEDGE WITH PRACTICAL EXPERIENCE, these Pans extract more gold and silver from their ores than any others in use, as a few hours trial will demonstrate. Mill men will find it to their advantage to employ these pans as Separators, in addition to the ordinary Amalgators now in use, and to re-work their old tailings.

The cost of these pans is inconsiderable, and their structure is such that they can be readily separated in parts convenient for packing on mules. Among the many advantages possessed by BAUX & GUIOD'S Pan, are the following: The trifling cost for attendance; Its small cost; Its portability; The large quantity of pulp it can operate upon in a given time; It may be worked even weeks without stopping, as it is constructed to work continuously; The complete thoroughness of the separation of the rock from the metals and the trifling power required to work them; They can be attached to any ordinary crushing apparatus.

We have the pleasure of referring parties interested to the following parties, who have our Pan in use: Jefferson Mining Company, Bowman's Ranch, Nevada county; The French Mill, Nevada City; Crall's Gravel Cement Works, Nevada county; Waltman's Chlorination Works, Nevada, Cal.; Gold Hill Quartz Mill, Washoe.

Manufactured at the Vulcan Iron Works and San Francisco Foundry, San Francisco, and at Heugh & Thom's Foundry, Nevada City.

For further particulars, or to see this Pan in operation, call on or address J. B. BAUX,

Fremont Street, near Mission, adjoining the San Francisco Iron Works, San Francisco. 4v8-6df

NEW MINING PUMP.

Excelsior Double-Acting Suction and Force Pump.

W. D. Hooker's Patent, August 15, 1865,

THE SUBSCRIBERS OFFER FOR SALE the following sizes of the above-named celebrated Pump, acknowledged to be the best Double Acting Pump known to be in use. They are more easily set in position, and are more durable and compact than any other Double Acting Force Pump; they are also worked with very little friction, and have greater forcing power than other pumps of like size. They are adapted to work by hand, wind-mill, horse, or steam-power.

No. 1—Cylinder 2¾ in., stroke 6 in.
No 2—Cylinder 3 in., stroke 7 in.
No. 3—Cylinder 4 in., stroke 10 in.
No. 4—Cylinder 5 in., stroke 15 in.
No. 5—Cylinder 6 in., stroke 18 in.
The Nos. 4 and 5 are Mining Pumps.

We have also for sale a full assortment of Pump Fixtures, such as Iron Pipe, Hose, Brass Goods, etc.

J. W. BRITTAN & CO.,

12v12-3m 120 Front street.

VARNEY'S PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setlers for themselves, at the PACIFIC FOUNDRY,

1v1 San Francisco.

PHILADELPHIA AGENCY,

Parties wishing to subscribe or advertise in the MINING AND SCIENTIFIC PRESS can be accommodated by calling upon our Agent, Mr. TURNER HAMILTON, at the Assembly Building, 106 South Tenth street, Philadelphia, Pa., where samples of our publications can always be found.

At the Potrero.—At Point San Quentin, on the Potrero, Capt. John North has an apparatus in operation, driven by steam, for hauling up sailing crafts for repairs. It is said to be the next in power to a similar one at Mare island, which it is known will haul up the largest sized vessels. *Potrero de Nuevo* is fast becoming a place of importance.

Builder.—Edward Nunan, builder, 319 Pine street, between Montgomery and Sansome, is one of our oldest master mechanics in the city. He is ready at all times to take charge of the construction of all kinds of edifices, both in the city and country. His residence is No. 426 Geary street.

Napa City, May 9th—Messrs. Dewey & Co., Patent Agents, San Francisco: Yours of May 7th is at hand. I am pleased to hear of the receipt of our caveat papers at the U. S. Patent Office, Washington, D. C. You have my fullest thanks for your energetic movements concerning the same. Respectfully, yours. W. W. Levering.

STOCK CERTIFICATES,
STOCK TRANSFER JOURNALS,
STOCK LEDGERS,
ASSESSMENT RECEIPTS,

And all other Blanks, Blank Books, etc., required by Mining and other Corporations, kept on hand or printed to order on short notice, at moderate prices, at the office of the Mining and Scientific Press.

Our Patent Agency.

The Patent Agency of the Mining and Scientific Press has been signalized with remarkable success during the past two years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of Letters Patent from the United States and foreign Governments cannot be over-rated, and the Proprietors of the Press, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

Endorsement by the Miners' State Convention.

The following resolution was adopted by the California Miners' State Convention, held at Sacramento, Jan. 17th, 1866:

Resolved, That we regard a mining paper or journal of great importance to the mining interest of California, and we recommend the Mining and Scientific Press, of San Francisco, to the consideration and support of the miners of the Pacific coast.

RUGGLES' PRINTING PRESS.

For Sale or Exchange.

The Proprietors of the Mining and Scientific Press have on hand a Half Medium Ruggles Engine Job Press, in condition good as new, which will be sold cheap, or exchanged for a good Hand-Press of medium or large size.

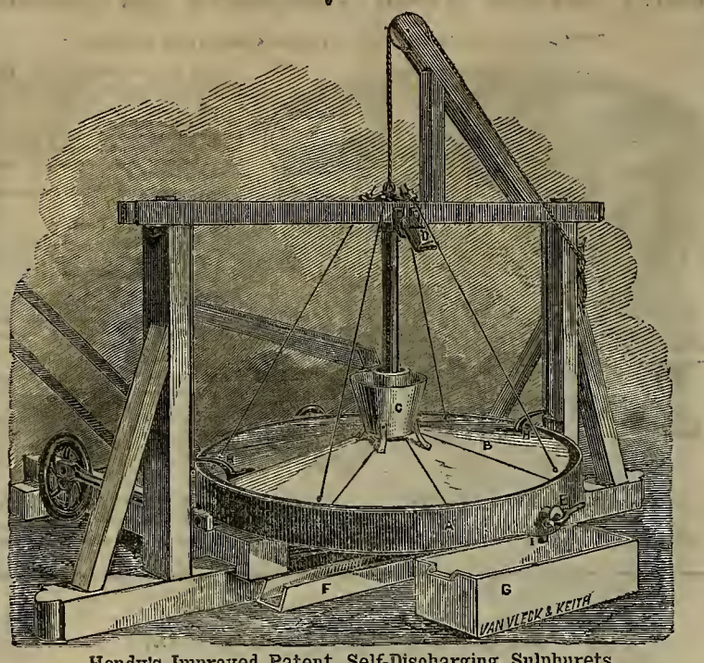
TRY IT 50 PER CENT SAVED BY USING
STANDARD SOAP COMPANY'S WASHING POWDER,

This powder is superior to all other preparations for washing and cleansing. It is made of pure material, and contains nothing that will injure the finest fabric. Equally as good for using in hard as soft water. One pound will make three gallons of beautiful soft soap. Put up in wrappers of 1-lb each, and in wooden boxes of 10-lbs bulk. Ask your grocer for a package and test its virtue. Manufactured at **207 Commercial street,** San Francisco. 15v12q

NOTICE TO QUARTZ MINERS.



Hendy's Improved Patent Self-Discharging Sulphurets
PRATER CONCENTRATOR
Is Receiving Universal Favor.

Reference is made to the following Mills which are using the Prater Concentrator, with some of the improvements attached. The Self-Discharging Sulphurets has been more recently adapted, and the public attention is called to examine its workings:

STEPHENS' MILL, Humboldt County, Nevada.
CHRYSOPOLIS MILL, " "
U. S. REESE RIVER MILL, Austin, "
UNION MILL, El Dorado County, near Mud Springs.
NEW YORK AND EL DORADO CO., " "
CONEY MILL, Jackson, Amador County.
Messrs. TUBBS & CO'S MILL, San Andreas, Amador Co.
WINTER'S MILL, Angels Camp, Calaveras County.
CLIO MILL, Jacksonville, Tuolumne County.
CARROL & ASPINWALL MILL, Reese River, Nevada.

And in use in other parts of this State; also in Idaho, Arizona, Colorado and Mexico.

As a further evidence of its worth, orders have been received recently from the proprietors of the following mills, all of whom are using these Concentrators, or have works in the immediate neighborhood of mills using them, viz.:
One Concentrator ordered for the Coney Mill, Jackson, Amador County, by Messrs. Bigelow & Bro., of this city.
Three Concentrators for the Spring Hill Mill, Volcano, Amador County.
Two Concentrators for the Golden Gate Mill, Volcano, Amador County.
Four Concentrators for the Raw Hide Ranch Mill, Sonora, Tuolumne County.
Six Concentrators for the Benton Mill, Bear Valley, Mariposa Co; ordered by Messrs Dodge & Bro, San Francisco.
They may be seen in operation at the GOLDEN STATE FOUNDRY, No. 19 First Street, San Francisco.
☞ For explanation of the above engraving, and other particulars, send for a Circular.

REGULAR MONTHLY MEETING.

MONDAY, May 7th, 1866.

President in the Chair.—The Committee on Rooms reported that the new room in the banking building, southeast corner Montgomery and Sacramento streets, would be ready for occupancy by the next meeting.

Donations to Cabinet.—Mr. Harford presented, through Dr. Kellogg, specimens of the "ivory nut" from Panama.

Dr. Gibbons made some interesting remarks in connection with a series of tables exhibiting the variations of rain fall, and their parallelism with the phases of the moon; showing that the greatest fall of rain took place immediately before the full moon, and that following the day of the full the diminution in quantity was very rapid. The observations from which the tables were prepared extend over a period of fifteen years.

Sundry bills were approved and ordered paid. Meeting adjourned.

W. H. DALL, Secretary *pro tem.*

W. FRINK, of Virginia City, Nevada, has sent us some very beautiful specimens of *fungi*, taken from a tunnel near Virginia City. They have been received in excellent order, and will be submitted to some competent naturalist for a thorough examination. We are inclined to think our correspondent's views with regard to the generality of "vegetable impressions" are correct.

THE PACIFIC FEMALE COLLEGE, Oakland, closes the present term with examination exercises, commencing on Monday next. The valedictory of the graduating class will be read by Miss Fannie A. Williams, on Wednesday evening, at the College of California, Oakland.

MAJ.-GEN. W. S. ROSECRANZ.—We are glad to notice the arrival of this distinguished and honored gentleman. As a talented engineer and practical and scientific mineralogist and metallurgist, his presence bodes much good among us.

BRASS CANNON.—W. T. Garratt, of this city, has just completed two fine pieces of brass cannon, at his Foundry, on Market street. They are for the Buckley Telegraph Expedition.

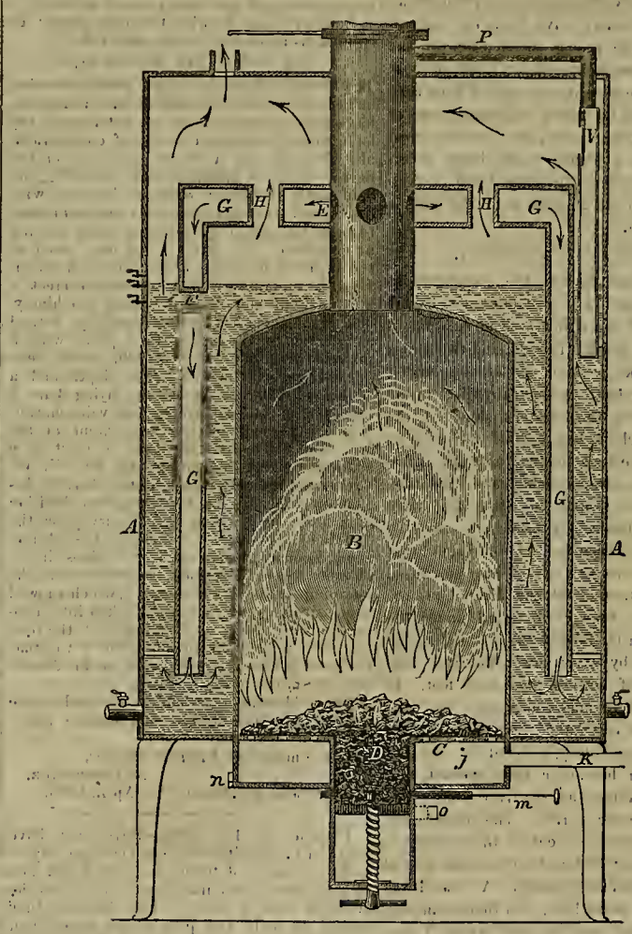
THE MINERAL from our friend W. S. G. has been subjected to three several assays, each time showing gold. A private letter will further explain.

THE FOSSILS from Capt. Faul have been received, and will be further noticed hereafter

THE GEOLOGICAL QUERIES of our correspondent "F. A. H.," will appear next week with comments

HOWELL'S STEAM BOILER.

Careful experiments have proven that there is sufficient power generated by the combustion of one pound of coal, according to its quality, to raise from six to twelve millions pounds one foot high in one minute. Of this immense force or power only from two to seven hundred thousand pounds are economized in steam engines by the use of boilers and engines as now constructed—that is, only about *five per cent.* of the actual amount of power generated! A vast field for improvement is here opened to the genius of our mechanics; and various modifications are from time to time put forth to still further economize this enormous waste of power. All such modifications and improvements are received with a great degree of interest by the mechanical world. We give annexed an illustrated description of one of the most recent, and a very ingenious invention, having this end in view.



HOWELL'S STEAM BOILER.

The air to support combustion is forced in beneath and through the grate, against pressure, by a cylinder blower; and the chief novelty consists in a conductor so constructed that through it passes all the heat which is not absorbed through the sides of the fire-box by the water surrounding it. The heated products of combustion are driven through it and discharged into the water near the bottom. The ashes and particles of grit which pass over into the water, become wet, and remain at the bottom, leaving whatever is valuable to raise and mix with the steam, and contribute to the motive power.

Another novelty consists in the manner in which the fuel is supplied. It is brought up from beneath, through the grate to the fire, instead of being thrown upon the surface, which will insure a more thorough combustion. The boiler is cylindrical in all its parts. The accompanying engraving represents a vertical section, and is described as follows in the *American Artisan* of February 7th, 1866:

A is a plain shell; B is the fire-box, extending through and below the bottom of the shell, to make an ash-pit, *j*; E is the flue passing from the top of the fire box through the head of the outer shell, and closed at the top by an air-tight slide; G is the conductor, through which all the heated products of combustion are conveyed downward into the water; it is formed by two concentric cylinders attached by their heads to the flue, E, at the point, E. A number of openings are made in and around this flue at E, making a free communication between this conducting space, G, and the fire-box, B. The conductor, G, is also open at the lower extremity. A number of tubes, a short distance apart and a little below the water-mark, connect the parallel cylinders, and pass through this conducting-space, as shown at F. A few also pass through the heads, as at H. C is the grate; K is the tube through which the air is driven by the blower, to support combustion; D is a tube for supplying the grate with fuel, in which is a piston, moved up and down by a screw from beneath. The water occupies the circular space between the fire-box and the outer shell, and rises high enough to cover the top of the fire-chamber.

In starting the fire, the piston, in D, is run down to the bottom of the tube; the slide at the top of the flues, E, is drawn, and the ash-pit door, at *n*, is opened, to admit air beneath the grate. A natural draft is thus obtained to start the fire. The fuel is supplied through a door, connecting the shell with the fire-chamber on a level with the grate; but not shown in the figure. At the same time the feed-tube, D, is filled with fuel. As soon as the water is sufficiently heated to produce steam freely, the slide at the top of E is closed, as in the figure, also the fire-box door, and the door at *n*. Air to support combustion is then forced through the tube, K, into the ash pit, *j*, and up through the grate. There being openings through the upper part of D to admit air, the coal immediately over it will burn equally as well as that upon the grate. The heat which is not absorbed by the water immediately surrounding the fire-chamber, B, rises with the gaseous products of combustion into the tube, E, passes through the openings into the conducting-space, G, forces downward and expels the water, which up to this time has filled the lower part of this space as far up as the water-line, and finally escapes at the lower end into the water itself, as indicated by the arrows. From this arrangement it is evident that all the heat is retained by the water. All ashes and particles of grit that are discharged through the conductor into the water become saturated and remain at the bottom, and can be discharged through blow-off cocks.

The piston, in D, is raised when additional fuel is required, until it has reached its position in the figure. If more is needed, the air-tight slide, *m*, is closed, the piston run down, the air-tight door, *o*, is opened, and through it the tube, D, below the slide, is filled with coal. The door, *o*, is then closed, the slide, *m*, is drawn out again, and the fresh coal is run up into the fire. Should the blower be stopped for any considerable time, and a leakage of air occur, the steam pressure might exceed that within the fire-chamber, and cause the water to return through the conductor, G, enter the tube, E, and extinguish the fire. To prevent this, a tube, P, leaves the flue, E, above the head of the boiler, and enters the steam space, and continues down nearly to the bottom through the water between the conductor and the outer shell. Its lower end is open. In this tube, in the steam space, is an opening, covered by a suspended valve, V. While the pressure is equal it remains closed, and prevents ashes, etc., from entering the steam spaces. When the steam pressure is in excess, it opens and allows the steam to pass through the tube into the fire-box, to equalize the pressure.

COAL OIL is a better article for preserving sodium and potassium than naptha. In coal oil, sodium keeps its luster for months and years, whilst in the purest naptha it is dimmed in a few days.

WE THANK the Monitor *Gazette* for the compliment which it pays us; but would say it is impossible for us to mail our exchanges any earlier.

Communications.

In this Department we invite the free discussion of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

Letter from Professor Brewer.

Editors Press:—A course of lectures to mechanics has just closed here, that has proved such a success that some notice of it may suggest thoughts of value to your readers.

The past winter the Professor in the "Sheffield Scientific School of Yale College" instituted a course of lectures for the especial benefit of the mechanics of this city. The largest lecture-room in the institution accommodates but two hundred persons, and so but that number of tickets were issued at the merely nominal price of one dollar for eighteen lectures. There were applications for more than twice that number of tickets immediately, but, of course, the accommodations forbids a larger issue.

The lectures were delivered by the Professors in the school, on two evenings of each week, commencing in January, and closing a week ago. The attendance was almost entirely from the class for whom the course was especially designed, and the interest was unabated to the close.

Each evening brought an intelligent, earnest and most attentive audience. As an experiment, the course was an entire success. The lectures were upon various subjects, rather than a continuous course on one science. Chemistry came in for the largest share, three Professors taking separate branches—one considering the subject of chemical affinity in two lectures; another devoted four lectures to the chemistry of the air, water, carbon and fuel; and another two lectures, on the smelting of iron and steel. In all eighteen Professors took part, and the following subjects received each a lectur: "Relation of Science to the present state of the Arts;" Architecture; Mechanical Drawing; Silkworms; Insects Injurious to Timber; California; The History of Writing; Perpetual Motion; Fungi pernicious to Vegetation, and Grape Culture in Gardens." All of the lectures, except three, as will be seen from the list, were upon some science of especial interest in the arts, or in practical life. They were properly illustrated by experienced specimens, diagrams and drawings, the institution being very rich in the means for such illustration.

Of the practical value of such lectures there can be no doubt, and it is the intention to continue them in future winters. Probably, however, in future, the course of any one winter will not be scattered over so wide a range of subjects, but be more full on some one or more of the sciences; but circumstance and experience will, of course, determine the plan to be pursued.

The deep interest taken in the subject the past winter by those for whose especial benefit the lectures were instituted, the many practical questions they proposed from time to time, and the uniformly good attendance, indicate the practical value of such means of instruction to adults. I have no doubt but that similar courses, or, at least, courses with similar aims, could be instituted in San Francisco, if a few moving spirits would work in the matter. Many of your practical mechanics could themselves enlighten an audience on the science and technicalities of their own craft. Information could thus be disseminated, more exact knowledge be brought to bear in the various branches, and the public would be generally benefited.

There is quite a *furore* now for *mining schools*, so called, in the colleges and higher schools East. I cannot enumerate the institutions that pretend to give more or less instruction in matters relating to mining and metallurgy; not only in the professedly "mining schools," but in the scientific departments of colleges, technical schools, etc. I notice even in one *agricultural* school, that of Pennsylvania, more students chose theses on mining than on agricultural subjects, judging from their published reports. How many of these beginnings will develop into full-fledged "Mining Departments," time can only determine.

The spring is late; or I might say that "winter" lingers in the North yet. We had snow here yesterday, while in the interior of New York, and in the northwest, much snow still remains, and streams that usually open earlier than this are still ice-bound.

Yours truly,
Wm. H. Brewer.
New Haven, Ct., April 10, 1866.

From El Dorado County.

BY OUR TRAVELING CORRESPONDENT.

[Continued from Page 303.]

THE NEW YORK AND EL DORADO G. M. CO.

Claim some 600 acres of timbered land, and a series of seven parallel lodes, one mile to the south of the Church Union and on the same range. Several of them have been opened by tunnels or shafts, the aggregate length of the former being about 400 feet, the greatest depth of the latter about forty feet, and exhibit the usual direction from south to north, together with the eastern dip. Three or four of their ledges, believed to be the best, and one of which is the continuation of the McNulty that paid some $40 per ton, lie along a lofty mountain ridge, and are to be cut at a depth of some 500 feet by a tunnel already commenced, and to be extended fully 800 feet. Near the mouth of this tunnel a 10-stamp mill has been erected, together with an engine of 75-horse power, put up in the best possible style by Capt. J. D. Woodworth of the Mitchell mine.

Considering the number of lodes to be opened, the machinery necessary, and the immense amount of labor to be performed before an enterprise so vast, and such as the original projectors must have had in contemplation, can be brought to a successful issue, it is very apparent that the superintendent has labored under great disadvantages, however enterprising or economical he may have been, for want of the means for the proper prosecution of the work. It is thought here that $7,000, in connection with the advantages derived from cash payments, would be barely sufficient, however judiciously handled, to put the mine into good shape, and on a paying basis, large undertakings requiring proportionally large outlays. In fact, the mill can do little until the mine is properly opened.

THE LEONARD G. M. COMPANY,

Crossing the north fork of the Cosumnes at Nashville, where it has a course nearly due north and south at a point three miles south of the New York and El Dorado, and two miles above the Forks, we find one of the largest blows or chimneys to be found anywhere in the county, or along the western slope of the Sierra. This claim was located as early as 1850, and at one time supplied as many as five mills with rock. In consequence of litigation and other causes similar to those that have operated so disastrously elsewhere, they all have long since suspended. I understand that all conflicting titles having been now purchased by Mr. E. W. Leonard of San Francisco, the company have been re-organized under the above title, and intend erecting a 20-stamp mill to be propelled by water power, the river having here a fall of not less than sixty feet. In this connection we might also state that the company own a very large river claim of 3,000 feet—ground previously covered by the old mill dam which has never been worked, and deemed very valuable as the river above and below was exceedingly rich. The quartz mine was at first opened by a cut on the chimney to the depth of sixty feet and covering an area of over one hundred feet square. A tunnel was then driven in to the lode, and thence through it to the east and hanging wall, which is said to be of granite. From a point on this tunnel near the west wall, which is, on the contrary, a black slate, a shaft was sunk, following the lode to the depth of 100 feet, or to about eighty feet below the channel of the river. From this level for a distance of 300 feet north, the vein has been stoped out upwards to within a few feet of the surface. Since the re-organization of the company, a new tunnel has been run in from the west, and at the southern extremity of the claim, the distance of some 200 feet, which, at a point 145 feet from the mouth, struck or rather passed through a most beautiful "gouge" of black vein matter upwards of fifty feet in thickness, composed principally of quartz somewhat decayed and fissile with a considerable intermixture of black clayey shale, containing a good proportion of the small irregular dark-colored iron sulphuret, to whose decomposition taken in connection with that of the black slate, the portion of the lode may to some extent, at least, be indebted for its peculiar sooty color. Mr. O. P. Hart, to whom I am indebted for most of the facts herein noticed, and who has full charge at present of the mine, assured me that the whole and somewhat decomposed mass turned out by mill process at the rate of $20 to $30 per ton. Lying next to this, going eastward, is what they here term, the true vein of ribbon quartz, at this point three and a half feet, and widening at the depth of 100 feet to not less than six feet, and said to bear a very striking likeness to the rock of the celebrated Hayward mine, distant only twelve miles south in the county of Amador. One ton, sent to San Francisco as a test, worked also by mill process $26.75, so that there can no longer be a question, as to the extent, stability and richness of the mine.

As still further evidence of its value, prospecting almost incalculably (if confirmatory testimony were needed), a communication has been recently made from the point where the new tunnel cuts this vein, with the upper level of the old works, thus demonstrating with almost mathematical precision from *actual measurement*, that some 12,000 tons can be immediately stoped out from this new level with no other labor than quarrying and hoisting, which at the rate of $25 per ton will yield the moderate little sum of $300,000.

Having now crossed the whole of El Dorado from Volcanoville on the north to this point, on or near her extreme southern boundary with facts as to her mineral resources ever accumulating along our path, we must say that *this mine alone*, excluding all others, however promising or valuable, ought to be sufficient to redeem her somewhat tarnished reputation as it respects the quartz interests, and place her name hereafter in the same catalogue with her better developed and more courted sisters.

Before closing, we wish to allude briefly to two claims adjoining on this same lode.

THE GORDON AND MONTEZUMA,

The former of 3,000 feet, first south extension owned by prominent parties in San Francisco, has a prospecting shaft on an outcrop of the lode, where it crosses a summit of considerable altitude, and also a tunnel entering on the north side of the mountain, and following the vein south, showing a width of six feet, with quartz and other characteristics similar in most respects to those of the Leonard, a fact needing no comment. The latter being next north of the Leonard, has lately come into the hands of English capitalists, who are about to erect a 20 stamp mill and other necessary machinery. The Montezuma has been successfully worked at intervals for the last thirteen years with a probable yield of about $150,000, having been opened by a shaft of 105 feet in depth, and a tunnel of 170 feet in length, laying bare a thickness of at least five feet of vein matter, that pays throughout the whole extent of the lode from $18 to $20 per ton. I must here acknowledge my obligations to Mr. W. W. Cromartie, the only representative here of his London associates, for his courteous exhibition of a map, made from actual survey for the benefit of his company, embracing the Montezuma, Leonard, Union and other mines in El Dorado herein described, together with the more important ones of Amador, which showed conclusively, (especially when taken into connection with the general similarity of the rock and other indications already alluded to), that the great gold range could not be far distant from the mines of this vicinity.

The gold and copper claims, situated to the west of those now noticed, will receive attention in our next.

In the meantime I remain, as ever,
A Prospector.
El Dorado, El Dorado Co., April, 1866.

Picking up Thoughts.—Boys, you have heard of blacksmiths who have become mayors and magistrates of towns and cities, and men of great wealth and influence. What was the secret of their success? Why, because they picked up nails and pins in the streets, and carried them home in the pockets of their waistcoats. Now you must pick up thoughts in the same way, and fill your minds with them, and they will grow into other thoughts; and you will find them strewed everywhere in your path. By so doing you may acquire even greater distinction than that of magistrates or mayors, who merely rule by the physical force of power committed to them by others. The *thoughts* which you gather in place of their *nails* may enable you to rule by the stronger and more ennobling power of genius. You may become a Patrick Henry, a Webster or a Clay, and rule senates by the magic of your eloquence.

Three young workwomen in good health entered in the service of a Paris manufacturer, who engaged them in filling boxes with those dangerous toys known as Pharaoh's serpents. After continuing their work for some days only they were seized with alarming illness, and were obliged to be removed to the Laribosiere hospital. Their lives have been saved, but their health is forever gone.

[Written for the Mining and Scientific Press.]

From Mariposa and Fresno Counties.

BY OUR SPECIAL CORRESPONDENT.

Editors Press: My notes for the past week show but little of interest to the general reader, in the way of description of actual mines; but as I have passed over a portion of the country comparatively unknown to the inhabitants of the rest of the State, some description of its resources and character, may be of interest to your readers.

After leaving Bear Valley, I again traversed the Chowchilla copper district, on my way to this place, and was enabled to form a much more complete and correct idea of its value than I had before. The furnace of Messrs. Henry & Co. I found still in operation. It had distanced the most sanguine hopes of its owners, having smelted four tons of pig copper daily, from silicate and carbonate ores, for several days in succession. It would be necessary, however, to stop in a day or two, I was told, as the ore on hand would be exhausted by that time. Haskell & Phillips, at Bachman Hollow, were also running their furnace; but the grade of ores on hand being very low, it was impossible to do good work. The ore was a mixture of red oxide and green carbonate, with clay and slate, which would probably assay four or five per cent. It was found very difficult to separate the metal from this gangue. One and a half miles below the Buchman, on the north side of the river, is

THE GENERAL GRANT CLAIM,

Owned by Messrs. Ault, Jones and Carton, who claim 2,000 feet on a vein running in nearly east and west directions, *across* the stratification of the country, dipping to the north at an angle of forty-five degrees. The vein shows indications of copper at various points on the surface; but at the shaft, where it is opened twelve or fifteen feet deep, the surface croppings show no signs of metal of any kind. At a depth of four or five feet, however, silicate of copper appears, followed by a blackish gray ore, having the appearance of containing large quantities both of copper and silver, while traces of antimony and arsenic abound. Various tests of this ore have been made by local "experts" in metallurgy; but as the results are very different and in many cases contradictory, I think they are very likely unreliable, and the value of the ledge remains still a matter of doubt.

Mr. Ault accompanied me on a visit to a piece of land claimed by Mr. Wm. Nelson near the Buchman, or *Ne Plus Ultra* mine, noticed last week, and on which he has discovered what is believed to be an extension of that vein. As the geological peculiarities of the two localities are precisely similar, and fine silicates and carbonates of copper may be found on the surface in large quantities, I think Mr. Nelson is in the right; that his location is a valuable one, the vein being a continuation of the *Ne Plus Ultra*.

A ride of eighteen miles, principally over a level plain country, brought me to Millerton, the seat of Justice for Fresno county.

MILLERTON

Is pleasantly located on the San Joaquin river, three-fourths of a mile below Fort Miller, and at the point where the river breaks from the mountains into the plains. The hills in the neighborhood, as well as the bed of the river, are of granite formation, and a short distance above the town are very high and steep, forming one of the most picturesque views in California. There is not a quartz mill in the county, and but one or two veins have been discovered, which promise to be of any value; but the placer mines on the upper San Joaquin, are said to be immensely rich. In Millerton I met several of the owners of the Buchman, or the Ne Plus Ultra vein, among whom are Judge Windell, County Judge of Fresno county, and secretary of the company, Sheriff Ashman and Dr. Leach, treasurer of the N. P. U. Co., from whom I obtained much additional useful information in regard to the present condition, resources and prospects of Fresno county.

The principal business of the people of this county at the present time is the raising of cattle and sheep, which prosper well, and find abundant pasturage on the broad plains and in

the sheltered valleys among the hills. There are thousands of acres of fine agricultural lands, but owing to the distance from market and cost of transportation, it has not heretofore been found profitable to cultivate any more grain than was necessary for home consumption; but the rapid development of the copper mines in the northern part of the county will doubtless open a home market, for all the cereals that can be grown. The worst drawback, both to the mining and agricultural interests of this county, is the lack of skilled labor. There is sufficient capital in the hands of many of the inhabitants to do much toward the development of their mining interests; but as a general rule the people seem to be appalled at the idea of *actually* engaging in physical labor. They like very well to mount a mustang and rush over the plains; but when it comes to taking up the pick or the drill, the thing is altogether impossible.

Leaving Millerton between three and four o'clock in the afternoon, and traveling by a circuitous route through the foot-hills, I reached the residence of Mr. Simpson on Dry Creek, some twelve miles south of Millerton, about seven o'clock in the evening, where I spent the night, and in the morning rode out in his company to visit his friend and neighbor Mr. Mat thews who, as well as himself, is a shareholder in the N. P. U. copper company. The settlement on Dry Creek is but two or three years old, but the farmers are alive and awake to the true interests of themselves and the country, and are raising large crops of hay and grain, and assisting as much as possible in developing the mining resources of the county. May they have many as prosperous seasons as the present one promises to be.

Leaving Dry Creek about eleven o'clock on Friday morning the 4th inst., I reached the fords of King's river, thirty miles south of Millerton, about three o'clock in the afternoon. King's river is a beautiful clear stream of considerably larger volume than the San Joaquin, and is divided at this point into over a dozen branches of various sizes, four of which are rivers of considerable magnitude; the largest being ten or twelve rods in width, and about three feet deep, with a rapid current. The "delta" formed by these branches is about five miles in width, of rich lowland, well adapted to growing Indian corn, sweet potatoes or cotton; but seems to be almost entirely uncultivated, probably on account of the danger of floods. On both sides of the river, next the plains are a few fine well cultivated farms.

After leaving King's River, and emerging on the plains, I was conscious of nothing of special interest except the piercing north winds, until within a few miles of this place.

VISALIA.

The county seat of Tulare county, is located on the "delta" formed by the separation of the Kawiah river into several branches before sinking into the tules. The town is beautifully shaded with oak trees, which form almost a forest for many miles in every direction. The land is low and very rich, adapted to the growth of nearly everything produced in the Southern and Middle States of the Union. The means of irrigation are abundant and cheap, owing to the small elevation of the land above the streams. Business for an agricultural town is very brisk indeed, and everything wears the appearance of thrift. With the exception of the principal business street, the houses are very much scattered, being built in the center of large lots, and generally hid away among vines and shade trees, until they can only be seen by coming up quite near them. A very large proportion of the houses are of brick, and they are generally of but one story, which, with their location give them a pretty, homelike aspect, which is very inviting to a stranger. The town contains a voting population of 900; its whole population being probably from 2,500 to 3,000, though to a stranger it would not appear to have over 800 or 1,000. There is one church, four hotels, a large flouring mill, and a dozen or so of saloons and stores. The public school numbers about 100 pupils, while Prof. Van Doren's seminary, a private school of much merit, usually has forty or fifty. I visited the seminary to-day, and witnessed the performances of some of the classes. Among them was a recitation in English composition, in which some of the pupils read some specimens of their work, which though plain narration, showed an originality of thought, and felicity of expression truly worthy of praise. I have formed some acquaintances among the people of this place and am generally much pleased with them, and I hope on my return from Clear Creek, whither I start to-morrow, to improve upon it.

Visalia, May 8, 1866.

When Alexander the Great saw Diogenes in a cemetery, he asked him what he was doing there. 'I'm seeking,' said the philosopher, 'for the bones of your ancestors among those of beggars; but everything here appears to me so confused and mingled together, that I cannot distinguish them.'

Mechanical.

A Substitute for the Steamboat Paddle Wheel.—Mr. Henry T. Lea, a tinsmith at Half Moon Bay has made application through the patent agency connected with this office, for a patent for an invention, which is intended to take the place of paddle wheels, as a propeller for steamboats. The invention consists in the substitution of thin, flat plates, attached to horizontal beams on each side of the boat attached to the main shaft, and arranged so that when the main shaft turns, one of the beams on each side is up, and the other down, and one letting the plates, (which serve as paddles), perpendicularly into the water, and then drawing them straight back, while at the same time, the other one is raised out of the water and moved forward out of water, ready to take the place of the other as soon as it is clear from the water. The action is precisely like that of a paddle worked over the side of a boat. Any number of paddles may be used. There is no power lost by either lifting, or carrying dead water. Mr. Lea has constructed a small boat, capable of carrying two men, to which he has applied his invention, and which is said to work admirably. We presume the experiment was made in smooth water. How it will work in rough water, or on a larger scale remains to be shown. We should like to see the invention subjected to a practical test, and shall illustrate it in the columns of the Press at an early day.

A Useful Invention. — Mr. Abraham Gregg, of this city, has exhibited to us a model of what appears to be a very useful invention, designed to enable street cars to pass around the short curves on our street railroads with as little wear and expenditure of power, as they are moved upon a straight line. The invention consists of three parts—first, the fore and hind wheels are attached to separate trucks and joined in the center by a connection similar to that employed to connect the separate cars of a train, instead of the stiff connecting reach generally employed; second, the axles are made in two pieces connected much after the manner of a "swivel" in a chain, by means of which when necessary, as in turning curves one wheel may make more turns than another, the connection between the two being kept up by the swivel joint in the center; the third improvement consists of a new device for attaching the tongue to the vehicle, which is much superior to any other employed. The invention is now being tested on car No. 16, of the North Beach and Mission Railroad, and with entire success, as Mr. Skelly the superintendent, testifies. It will doubtless be universally adopted by railroad men, and we trust that the ingenious inventor, who is really a deserving gentleman, quite advanced in life, may reap a substantial benefit from it, as a solace for his declining years. Mr. Gregg has made application through our Agency for a Patent of his invention.

A New Gun Lock.—William Rudolph and Al Braun, of this city, have obtained a patent through the Mining and Scientific Press Agency, for a very valuable improvement in gun locks. The improvement consists in discarding the inner plate of the lock, over the tumbler, and letting the spring and tumbler into the outside or main plate, instead of allowing it to project into the inside of the stock, as with the ordinary lock. A smaller plate, lying flat on the inside, covers the spring and tumbler completely, rendering the lock as nearly as possible water-proof. Their locks (the invention is applicable to either "direct," or back-action locks) are far more simple than those in common use, and generally considered the perfection of art, and furthermore, do away with one great objection to the old style, obviating the necessity of cutting into the stock to such a depth as to weaken it, and render it liable to be broken by even a slight blow. The new lock fits on rather than into the stock, and strengthens rather, than weakens it; as it is not necessary to cut away the wood to any considerable extent to fit the lock. Mr. Rudolph has gone East to commence the manufacture of the lock.

According to Dr. Franz, an absorption of 3.54 per cent takes place during the passage of heat through a column of air ninety centimeters long; for colored gases the absorption is greater; but all colorless gases now show marked divergence from the atmosphere.

Bessamer Steel in Austria. — A recent number of the Austrian *Journal of Mining and Metallurgy* has an important communication from an iron-worker, in which he says that whilst engaged in the iron works of Stori, he had an opportunity of collecting a number of important facts regarding Bessemer steel, which he thinks the great expansion that the new method of producing steel is undergoing, renders interesting and valuable to the mechanical world. The Stori steel works produce their steel in massive blocks, which are wrought therefrom by hammers and rollers into a merchantable shape. Before placing them in the market, however, samples are taken from these blocks and submitted to the most severe tests, some of which he describes as follows:

An eight-sided bar, two and a half inches in diameter, was taken, and by one heat wrought into a rectangular bar, one inch by one-half inch, with clean, sharp corners. This was heated once and sharpened to a point; the sharp end was cut off and a nail head made upon it; this nail was bent around an anvil corner while cold.

Another rod, one inch by one-half inch, was bent like the letter S, hammered together and welded; the thick mass was hammered out to a point, without showing any breaks in the corners.

In a one eighth inch plate fifteen holes were punched, one-twenty fourth inch, apart, the plate remained without a crack, and the holes looked as though they were bored; the corner of the plate was then bent down like the corner of a visiting card. A bar 1¼x½ inch was hammered into a chisel, hardened, and used to chip castings with excellent results; it was broken, and showed an excellent steely fracture; the other end was bent cold to a right angle without cracking it in the least. No evidence of red shortness appeared in any of the samples.

New Method of Rolling Iron.—The Boston *Advertiser* says: A recent invention of a new method of rolling iron is one of the most important yet made for the working of this useful metal. It consists of a process for rolling into irregular shape, by which checkered surfaces, projections and depressions can be obtained with the same facility as plain surfaces have heretofore been produced. This result is accomplished by means of adjustable discs, of any desirable pattern, placed upon ordinary rollers, which leave upon the bars drawn through them the impress of the figures which they bear. Instead of solid rolls turned with grooves and peripheries in the ordinary manner, the inventor uses the cast or wrought iron spindles, on which are slipped cast iron, steel rings or discs, forming grooves or peripheries corresponding to those of ordinary rolls, and susceptible of an almost infinite variety of combinations. The spindles are allowed to project beyond the housings of one side, thus giving an opportunity for placing upon them every variety of pattern discs, and requiring but a few minutes to effect any desired change.

The Iron Product.—The returns of the anthracite furnaces of the United States for 1865 show a marked decrease in products, compared with the results of their operations during the previous year. Of the thirty furnaces in the Lehigh group, twenty two are now in blast. In 1865 the production of this region amounted to 177,438 tons, being 36,655 tons less than in 1864. Two of the establishments in this group exhibit a falling off of 25,000 tons in their united production.

Interesting Experiment. — The Pittsburg mining and manufacturing *Journal* reports the following interesting and important experiment: "A sample of pig-iron which, after having been re-melted and kept fifteen minutes in fusion bore a strain of 20,336 pounds; bore, when kept in a state of fusion for 2½ hours, 27,456 pounds; when 4½ hours in fusion, 29,227 pounds; 6¾ hours, 36,312 pounds; and 7¾ hours, 37,552 pounds the square inch. The density rose from 7,175 to the first, to 7,343 in the last experiment."

Heat Produced by the Agitation of Water.—While engaged in experimenting on the evolution of heat by the agitation of water, Mr. Rennie made use of a kind of churn capable of containing ten pounds of water, and which revolved at the rate of 232 revolutions per minute. He succeeded in raising the temperature of the water to boiling point, and, as an illustration, an egg was boiled hard in six minutes. A large portion of the heat generated in the Freiberg barrels may probably be accounted for in this manner.

A New Crushing Machine. — The Enterprise company of Meadow Lake District are now using a crushing machine for reducing their ores, constructed on a principle involving much novelty. The machine is an improved Chile mill; the improvement consisting in an arrangement for constantly presenting to the crushing face of the wheels a new supply of the ore, from which all that was reduced sufficiently fine by the previous passage of the wheel has been removed. The advantages of such an improvement, if it can be made practical, must be apparent to all. The inventor, Mr. King, claims to have done this, and has taken the necessary steps to secure a patent for the same through the Mining and Scientific Press Patent Agency. It is said that a machine is at work at the Enterprise mill, and giving good satisfaction. The machine is composed of three iron wheels, six feet in diameter with six-inch face, weighing, with the axles and other accompaniments, 2,100 pounds each. These wheels are revolved by rotating a large iron plate or disk resting upon the top or circumference of the wheels. This disk is so arranged that any required weight, say of fifteen tons, more or less, can be placed upon it, and thus added to the weight of the wheels. The ore is scraped off from the surface upon which the wheels revolve, passed through a sieve of the necessary fineness, and then elevated so as to be again automatically or otherwise placed before the wheel for a second crushing. We are informed that carefully conducted experiments have shown that this mode of crushing effects an important saving in the expenditure of power over the use of stamps, with the added value of crushing the rock dry. We hope soon to be able to give a more particular description of this machine, and should be pleased to hear that it continues to give satisfaction.

Gold Test.—A good test for gold or silver is a piece of lunar caustic (used nitrate of silver). In using this material it should be properly fixed in some instrument convenient for handling. Slightly wet the metal to be tested, and rub it gently with the caustic. If the metal be gold or silver, the mark will be faint; but if an inferior metal, it will be quite black. Jewellers who purchase old gold, often use this test.

The Most Fusible Alloy.—The most fusible metal has hitherto been composed of—bismuth, 2 parts; lead, 1; tin, 1; and its melting point is about 160° F. But an alloy, composed of four cadmium and five each bismuth, lead and tin, has recently been found to fuse at about 180° F.

Singular Fact with Regard to Alloys.—Alloys in which the preponderating metal is the worse conductor of heat present the curious result that they conduct heat as if they did not contain a particle of the better conductor; the conducting power of such alloys being the same as if the bars used in the experiment were entirely composed of the worse conducting metal.

The sensation upon the ear, connected by means of a tube with water in sonorous undulations, was found to be much greater than that upon the ear connected with the same water by means of a solid rod. When both tube and rod were employed simultaneously, sound was heard only in that ear supplied with the tube.

Copper a Preventative of Cholera.—In support of the theory of the preservative action of copper against cholera, it is affirmed that the great district of copper pyrites of the Rio-tinto, and its prolongation on the Heulvalia Spain, has never been visited by cholera.

Where was the First Rail Rolled?—Mr. W. S. Langridge, of Aldermusley Iron Works, Ambergate, says, in the London *Mining Journal*: "The first rail ever made was at the Bedlington Iron Works, Northumberland, and from these works a staff of men were sent to Penydarron, to teach the Welshmen to make rails."

The Iron Ore of Tennessee is abundant, easily worked, and yields in the rough way from thirty to fifty per cent. of iron.

"Grinding Effects of Differently Formed Plates, Practically Considered."

REPLY TO NUMBER SECOND OF W. A. GOODYEAR, CIVIL AND MINING ENGINEER.

BY P. M. RANDALL.

MESSRS. EDITORS OF THE MINING AND SCIENTIFIC PRESS: I see by your issue of May 12, 1866, that Mr. Goodyear is not quite ready to substitute the *calumet* for the *hatchet*. He, however, shows signs which bespeak an early peace. A broad streak of light already appears on the horizon, and I question not but that it may soon be said—

"The morn is up again—the dewy morn,
With breath all incense, and with cheek all bloom,
Laughing the clouds away with playful scorn,
And living as if earth contained no tomb,—"

Recognizing Mr. Goodyear a highly talented and accomplished mathematician, I can but congratulate myself to find him indorsing, almost to the fullest extent, my deductions relative to the "properties of grinding plates." In the SCIENTIFIC PRESS, page 290, he observes: "By comparing the above results with Mr. Randall's recapitulation, on page 269, it will be seen that we now agree with reference first to the mutual ratios for entire plates of equal weight among themselves; and second to the mutual ratios for ring plates of equal weight among themselves; but that we still disagree as to the ratio between entire plates and ring plates of the same weight."

Now on this point, by reference to my first reply to to Mr. Goodyear, it will be found that I did not presume the weight of the ring plate in any of the cases recapitulated, equal to that of the entire plate. It is thus so expressed, both by word and formula. If, however, Mr. Goodyear has succeeded in making this point clearer to the public mind, I shall be found the last in attempting to pluck a laurel from his brow. Again, Mr. Goodyear, after complaining that the merit of his errors were not better appreciated, and after recounting, with evident satisfaction, how he subsequently corrected those errors and made his new deductions to conform perfectly to those already obtained by the author of the "Supplement to the Wheeler & Randall's Quartz Operators' Hand Book," becomes highly self-congratulatory, and observes: "It will now be evident, I think, both from what I have said and from Mr. Randall's own admissions, that the Hand Book contained in principle, as well as in detail, sufficient errors and 'fallacies' to justly subject it to criticisms as severe as any that I have made."

This is decidedly refreshing, if not altogether modest, and brings to mind the words of another hero equally entitled to the special merit claimed as he relieved himself of his burden: "There is Percy, if your father will do me any honor, so; if not, let him kill the next Percy himself."

Let us now turn our attention to a more practical consideration of the properties of grinding plates.

At or near the close of my first reply to Mr. Goodyear, page 260, I remarked: "What was claimed and is claimed and is true, is that the tractory formed pan will do very much more work than either the flat or conical pan of the same weight; and I will now add, do the same amount of work at a less expense of power."

Now, on the other hand, Mr. Goodyear denies the truthfulness of this proposition, and says, on page 291, at or near the close of his discussion: "The errors into which I fell myself, though they affected my numerical results, *did not* affect the *main* and *important* points upon which I insisted, and upon which Mr. Randall is wrong, which are: first, uniformity of vertical wear independent of the particular form of the surfaces; and second, grinding effect *considered* in *connection* with power, the only just standard of comparison. And my first assertion that in this light the tractory conoid possesses no peculiar advantages remains undeniably true."

From a theoretical stand point, both Mr. Goodyear and myself have discussed the properties of grinding plates as if they came in direct contact in all their grinding parts; or at most, that only a layer of material *infinitely fine* intervened between them. This, in practice, is not true; for the material to be ground varies from the one-hundredth part, or less, to a half inch or more in diameter. Such being the case, the fineness or coarseness of the material to be treated becomes an unavoidable element in our practical considerations. If, now, this element be introduced in our considerations, and we employ plane circular plates, reason tells us, an opportunity being afforded, that the wear at the outer portions of the plates will be greater than nearer the center. Reason tells us that the opportunity is afforded in measure nearly corresponding to the fineness or coarseness of the material, and that hence the form of the plates will be changed accordingly, that the plane plates will become conical at their grinding surfaces. Reason tells us still farther, that the portions of the grinding plates near their centers come to a "*close ground joint*," and that the motion here being slow, and the surfaces becoming smooth, and the material being thus prevented from coming between them at these points, that the plates wear away slowly, and hence accomplish comparatively but little grinding effect. Now all these things which reason tells us, practice confirms to the fullest extent. On this point the authority of practical mechanics is conclusive. Now in practice, as well as in theory, it is found in tractory formed grinders or plates "that perfect uniformity of wear in the grinding surfaces is attained by the use of the curved face," as hitherto quoted. These things being so, how stands the *first* of Mr. Goodyear's "*main* and *important* points," to-wit: "uniformity of vertical wear independent of the particular form of surfaces"? It is evident that Mr. Goodyear's position is utterly untenable.

Now we may well infer that in practice, the disproportion in the *distribution* of *pressure* is much greater than in theory. Now, if Mr. Goodyear will carefully examine the analysis by which I obtained the proportion, to which he refers on page 290, to-wit: S : V :: E : G. he will readily perceive that I do not admit an equal distribution of pressure in plane and conical plates of uniform hardness. That proportion was derived from an entirely different state of facts, as clearly appears in my discussion of Plate *A*, page 259, and page 260.

Let us now discuss my proposition "that the tractory formed pan will do very much more work than either the flat or conical pan of the same weight, and do the same amount of work at a less expense of power."

To the first part of this proposition, namely, "that the tractory formed pan will do very much more work than either the flat or conical pan of the same weight," and of the proportions hitherto discussed, Mr. Goodyear fully accedes. On page 291, he says: "The tractory conoid does produce a greater effect in a single revolution than the other forms considered." Nor, as to the measure of this effect, as theoretically determined by us both, do we disagree. Each finds the relative grinding effects of the several pans to be for—

Plane or flat bottomed	1.1852.
Conical	1.3251.
Tractory	1.7778.

To the last part of my proposition, namely, "and do the same amount of work at a less expense of power," be emphatically objects. Now the manner of working these different formed pans, is to put a large amount of ore, say 1,500 or 2,000 pounds into them, adding sufficient water to it to reduce it to a pasty consistency.

Now if the muller be raised from the stationary plate so as not to grind at all, it is evident that it requires an expenditure of no little power to stir this mass and to carry it around. Each revolution costs some power.

The cost of this power depends much upon the consistency of the mass treated, and the velocity of the muller. On an average, it is probably not less than fifteen per cent. of the whole power expended when the muller is let down to its full weight or grinding capacity.

This conclusion is based upon the opinions of practical mechanics and quartz operators. But whether the expenditure, comparatively, be more or less than fifteen per cent. of the entire power, matters not in this discussion. It is sufficient for our present purpose to know that no inconsiderable amount of power is expended for stirring and carrying around the mass.

Now the unavoidable conclusion is, that the pan or muller acts in two capacities: first, that of a grinder; second, that of a stirrer or carrier. Taking the relative grinding effects of the plane, or flat bottomed pan, at 1.1852, and the grinding effects of the tractory formed pan at 1.7778, (which numbers are nearly in the ratio of two to three), as determined both by Mr. Goodyear and myself, let us see if my proposition is not rigidly and practically true that the tractory formed pan will "do the same amount of work as the plane or conical pan at a less expense of power." Let there be no misunderstanding in reference to the use of the term *work*. It is used in its practical sense "available or economized work." It is now evident, the pans being equally charged in all respects, if the flat muller be revolved three times and the tractory muller twice, that each will grind the same amount, (nearly). Each will consume the same amount of power as grinders for the equal quantities ground. But since each muller, at the same time, acts as a stirrer or carrier, it is plain that in this capacity the flat muller revolving three times will consume three parts of power, and that the tractory muller revolving twice will consume but two parts of power, and hence, that there is a gain of one part of power in favor of the tractory formed pan.

Now, of the whole amount of power expended in each, if fifteen per cent. be allowed for the purposes of stirring or carrying the mass or pulp, it follows that there is a saving of seven and a half per cent. of power in favor of the tractory formed pan over the plane or flat bottomed pan.

Therefore, on this, the second of Mr. Goodyear's "*main* and *important* points," it seems to me that he finds himself about in the position or predicament of a certain character in the "Georgia Scenes" "who could look but one way, and that upward."

He probably begins to see that the least of all my fears was that of "lugging power" as a subject into the discussion.

Again, from a practical stand point, it has been shown that the difference in the grinding effects of the plane and tractory formed pans is greater than that determined by theory, hence the true per centage in practice in favor of the tractory pan is greater than above shown.

But farther, let us look at the truthfulness and practicability of this proposition of Mr. Goodyear, viz: "Neither these" (referring to the tractory, also conical pan of certain proportions,) "nor any other forms produce an increased grinding effect except at the expense of a precisely proportional amount of power, and we can obtain this same result with any form by increasing the weight or size of the plates."

In the first place, this proposition is not strictly true; for if the weight is increased, the size of the muller is increased; hence, greater friction in stirring the mass results. But as to the "practicability." The increase in the muller involves an increase in the height of the rim of the pan and corresponding strength throughout its structure. Hence, we see that the entire weight of the machine would be greatly increased, the first cost would also be increased, the freight cost would be increased, the cost of "*setting up*" would be increased, and the subsequent cost and inconveniences of working would be increased.

This will never do. Quartz miners and operators, who, with Job-like patience, have endured "Rotary Batteries," "Hell-Roarers," "Concussion Concentrators," "Dry Amalgamators," "Secret Processes," double and twisted, compound hyfaluting compelexities, and a thousand and one other gimcracks, would dishonor at sight this invention of Mr. Goodyear.

The elements of lightness, convenience, durability and efficiency, quartz operators seek to find combined in any machine invented for their use. All these they find to greater perfection in the tractory pan than in any other yet offered to the public.

It seems unnecessary to institute a comparison direct between the tractory and conical pans, farther than to say that the ratio, theoretically determined, does not hold good in practice. That in fact, the efficiency of the conical is not above that of the flat bottomed pan. The reason of this apparent discrepancy between theory and practice, to no little extent, arises from the unsteady and swinging motion of the conical muller having its greater base upward. That is, the muller wearing away at its greater circumference and then coming to bear almost entirely on its lower and smaller base, seems to "toss about and labor like a ship in a heavy sea," without scarce making a single knot toward the destined haven.

In consideration of the foregoing facts, it does seem, Mr. Goodyear to the contrary notwithstanding, that the tractory pan does possess peculiar advantages over the flat bottomed and conical, in very many respects.

In conclusion, allow me to adopt the language of another, and say: "Among the feelings which at this moment fill my breast, not the least is that of regret at the position in which" Mr. Goodyear "has placed himself. He does himself no justice. The cause which he has espoused finds no basis in" mechanics and practice, "no succor from public sympathy, no cheering" from a mining "community. He has no foothold on which to stand while he might display the powers of his acknowledged talents. Every thing beneath his feet is hollow and treacherous. He is like a strong man struggling in a morass: every effort to extricate himself only sinks him deeper and deeper. 'And I fear the resemblance may be carried still farther; I fear that no friend can safely come to his relief, that no one can approach near enough to hold out a helping hand, without danger of going down himself, also, into the bottomless depths of this Serbonian bog."

From the Stock Circular of Associated Brokers of the S. F. Stock & Exchange Board.

SAN FRANCISCO, SATURDAY MORNING, May 19, 1866.

The demand for Money is light. The market is well supplied with available means, and a greater accumulation of capital may be noted. It seems to be conceded now by many of our banking and business men that rates of interest are likely to be still farther reduced the current year by the increasing competition of money-lenders. The prevailing rate in Bank is 1 ₱ cent. per month, with occasional transactions at 1¼. In the open market, loans are made at 9 ₱ cent per annum to 1½ ₱ cent per month; nothing, however, but the choicest securities being taken at the lowest range.

Receipts of Treasure from Domestic sources since the date of our last reference, amounted to $1,100,000, making an aggregate of $2,600,000 thus far during the current month.

There has been some inquiry for Bullion this week, with inconsiderable sales at slightly higher figures. Gold Bars may be quoted at 850 and Silver is varying at ¾ to 1¼ ₱ cent. premium—the latter for bars of high grade.

Legal Tender Notes are a shade lower and sales have been made at 78@78½c, closing at 77¾c bid; 78¼c asked. Latest telegraphic advices from New York quote Gold at 130, and Sterling Exchange at 109½. This rise is said to be owing to the return of some of our Securities from Europe for sale (growing out of complications between Austria and Prussia), and the renewal of specie shipments from New York.

City and County Bonds and Miscellaneous Shares (other than mining) are still in favor and at higher rates than most of them have ever before attained. Money is now so abundant and cheap that many capitalists find it difficult to employ it except in the purchase of these Securities. Some $50,000 City and County Sevens of 1865, have been sold at 85, adding interest since first Inst. This is equivalent to a little over 8 ₱ cent. per annum. Pacific Insurance Company is in demand at $180, and Union Insurance at about $120 ₱ share. The capital stock of the latter is now fully paid, viz: $750,000, and their surplus accumulations to April 30th amounted to $102,911, making an aggregate of $852,911.20. This Company have no debts, and disbursed during the last year only $14,072 for losses. California Steam Navigation Company was dealt in at 61 ₱ cent., and Spring Valley at $68 ₱ share. Sacramento County Bonds can be sold at 55c, and San Francisco City Gas at $110 ₱ share.

The Mining Share Market has been exceedingly dull, and marked by little or no speculative feeling. A few leading Stocks have been well maintained at prices ruling last week. Some have improved a little, though inactive, while others are lower and close weak at the decline. Advices from Nevada are meager this week, both through official and private sources; but so far as we can learn, there is no especial reason why the market should be unfavorably influenced at this particular juncture.

Crown Point was sold at $1,250 and $1,225, ex dividend of $80 ₱ foot; then at $1,200, and closes at $. During the week ending 13th inst., 653 tons of ore were extracted. From the west stratum considerable ore was taken last week of better than the average quality. Active operations have been temporarily suspended in this mine, owing to repairs necessary to be made to the shaft, but these improvements are now completed.

Savage met with trifling sales at $970@960, closing at $975. No official reports have been received this week. During the past few days the mine has been producing 80 to 90 tons of ore per day, chiefly from the sixth level. The latter is said to look well as its development progresses.

Hale & Norcross was sold at $970, then at $950, ex-dividend of $50 ₱ foot, and closing at $975 asked. There is no change to note in the condition of the mine, every portion of which is said to look well. The drift from the incline will soon be underway for a new level at a depth of 765 feet.

Gould & Curry continues dull and inactive. Small sales were made at $850@855, closing at $850. Receipts of bullion for the first ten days of this month amounted to $64,000. Explorations in the lower drifts are progressing with great vigor.

Yellow Jacket rose from $715 to $765, then sold at $775, and was dealt in yesterday at $735@740. The officers of the Company in Nevada have not as yet furnished the stockholders in this city with an exhibit of their affairs for the past month, nor have any official statements been made public since the 25th of April. We are informed, however, that certain portions of the mine are more promising than for some time past.

Ophir is in less request, and some 400 feet have been dealt in; steadily declining from $570 to $460, rallying to $485, dropping to $450, then selling at $400@410, and closing yesterday at $425. Developments this week are thought to indicate a material change in the quality of ore to be taken from the ninth level. In stopeing up and in drifting north little or no ore has been met with recently, but in going south it is said to hold out well.

Chollar-Potosi has been in little favor, and very considerable sales were made, advancing from $326 to $357½, receding to $341, then selling at $346, and closing at $337½. No official reports have been received this week, but private advices represent an improvement in the appearance of several stations.

Alpha receded from $305 to $255, and then sold at $240. Belcher is also lower, declining from $332 to $307½, and selling yesterday at $300@305. Empire Mill & Mining has been dealt in at $175@177½ per share, closing at $170 bid.

Imperial rose from $128 to $135, dropped to $128 again, then sold at $131, and changed hands yesterday at $130. The Rock Point Mill reduced some 2,300 tons of ore last month, averaging $34.91 per ton. It is thought that considerable ore can yet be taken from the sixth level. The drift for the next level below is in some 160 feet from the shaft.

Overman has been actively dealt in, and nearly 1,000 shares were sold advancing from $82 to $87, steadily declining to $73, then selling at $74, and closing at $65. Bullion fell from $90 to $80, rallied to $84, and sold yesterday at $80. Daney has been sold at $11, and Goldea Rule at $20.

The total recorded sales of Stocks since Saturday last inclusive, amounted to $737,547.

Mining Summary.

CALIFORNIA.

Alpine County—

We glean the following items from the Monitor *Gazette* of the 12th inst:

The workmen on the Mowyer are now in over seventy feet with the tunnel and making good headway. They are running in the casing of soft rock alongside the ledge, and when sufficient depth is attained for the purpose, will cut across and test the vein.

We are happy to be able to state that yesterday the last load of the first installment of about four tons of ore from the Buckeye No. 2, was hauled to the Pioneer mill for a working test. We await confidently the result of this test, and then, as we suggested before, "we shall see what we shall see."

Roderigo, of the Peacock lode, showed us this week a quantity of retorted amalgam obtained from a working of the ore in his arastra. Señor Roderigo, who is an old assayer and worker of silver ores from Mexico, assures us that the prospect obtained is very flattering.

The Sailor rock prospects finely.

Amador County—

The *Dispatch* has received specimens of rock from the Mount Echo and Tussimita claims, on the celebrated Soapstone, or talc lode, located on the divide betweeu Dry creek and Horse creek, about four miles below Drytown. It thus speaks of them: "The specimens are studded with fine gold, and have the appearance of the richest kind of specimens of quartz rock; aud yet the substance is entirely clear of grit, and so soft that blocks can be whittled or shaved into any imaginable shape. We are credibly informed that twenty-four hundred pounds of the rock, which was crushed in one of the quartz mills near Amador City, yielded thirty-six dollars and twenty-five cents. It has been found by actual experimeut that the rock can be ground in a common flouring mill at the rate of one hundred pounds per minute. In fact 1,300 pounds were crushed in a flouring mill near Ione City in thirteeu minutes. The shaft in the Mount Echo has been sunk to a depth of 50 feet, and the vein is ascertained to be about 22 feet in width."

We alluded to these claims some three months since—noticing the singularity of the occurrence of gold in steatite.—Eds. Press.

Calaveras County—

The "Gold Hunter," in Salt Spring Valley, is now yielding rich rock.

The *Courier* of 12th inst., says:

Prospecting is still on the increase. We have heard of several new discoveries being made, within the last week—real, *bona fide* gold-bearing quartz leads—upon the most of which men are already earnestly at work. The Sulphuret lead, in Dutchman's Gulch, is being systematically and rapidly developed. A large number of men are employed in this mine, and it is the intention of the company to erect a mill the present season. The custom mills are all crowded, and there is *now* more rock out than they can possibly crush during the season.

The new quartz discoveries at O'Byrne's Ferry had caused a considerable excitement in Copperopolis.

Contra Costa County—

The *Gazette* of 22th instant, learns from a friend who visited the Welch Quicksilver mine last week, that it is developing promisiugly.

Humboldt County—

Oil.—Work has been discontinued on the Brown & Knowles well; also on the Mattole Creek.

The North Fork is down 230 feet. At 207 feet a vein of oil was struck, which has been yielding ever since.

At the Jeffrey well they have attained a depth of 418 feet. They expect to have their engine in running order in the course of a week or two.

At the Joel's Flat they are still awaiting the arrival of materials, aud are continuing to siuk shafts.

The Upper Mattole is down 204 feet.

The Irwin Davis is down 655 feet. At this poiut they encountered a stratum of coarse sandstone which gives off a strong odor of petroleum, and which increases as the drill penetrates it.

Mariposa County—

From Coulterville correspondence of the *Gazette*, we gather these items:

H. G. Cowan & Co. have gone to work in earnest in the old Marble Spring vein.

Wright & Spencer have started their new mill on the North Fork, near the Bower Cave.

Captain Arni is crushing rich rock out of the vein lately struck by him, and now owned by himself and John Hite and other partners.

Nevada County—

The following items are condensed from the Grase Valley *Union*:

The new machinery just completed upon the claim of Frank, Moore & Co. has fairly got under way and works to a charm. The incline is now in some forty feet, and will be pushed to a depth of one hundred and fifty feet for the first level. The company commenced sinking the extension of their incline on Monday.

The mill of the Eureka mine has been shut down temporarily, for the purpose of making necessary repairs.

Real estate in Grase Valley is rapidly rising.

A compromise has been effected between the Illinois and Wisconsin companies, both of which claimed what was supposed to be the same ledge. These two companies have been consolidated into one, under the name of the Wisconsin Mining Co. Work will now be pushed forward as rapidly as possible.

The new hoisting works at the Alison Ranch are progressing rapidly. The southern incline is down some three hundred feet, and cuts a very handsome ledge between the upper and lower levels. This ledge has been named the Carnboo, and promises to be richer than anything that has yet been discovered in this mine.

The *National* says: A vein of very rich rock was struck a day or two since, in the Soggs' mine, on Deer Creek. The rock which the company have been taking out herctofore, paid about forty dollars per ton.

Rough & Ready, although it has twenty or thirty ledges in its vicinity, which would pay for working, is nt a stand still for want of capital to develop them.

At the Ione mine, the amount realized in a week's run, was one hundred and eighty ounces. The company are still on the first level and the mine is, comparatively speaking, yet unopened.

From Meadow Lake we learn that the weather of late has been quite warm, the snow melting rapidly or settling, so that only four or five feet is left.

Meadow Lake is regularly laid out with streets eighty feet wide and a plaza 300 feet square. There are 300 buildings. Town lots from $600 to $2,000 each.

San Juan North is coming up again. The *Transcript* says:

All the claims in that vicinity are paying nearly double their old yield, a great many new ones are opened, and thousands of dollars have been taken out every week. There is not a house for rent there, and the merchants are all doing a very healthy business.

The following items are from the *Gazette:*

Some years ago a Frenchman named Ducray accepted in payment for a debt of thirty dollars, a claim, situated near the office of the ditch company. This spring he thought he would try his claim, when he struck into a lead of gravel which had been covered up by an old slide, and after running four weeks he cleaned up 265 ounces of gold, worth nineteen dollars an ounce—amounting in all to a little over $5,000.

A rich quartz strike was made a few days ago near Brush Creek. A tunnel into the ledge struck a pocket from which the discoverers have taken out several wheelbarrow loads of quartz, which is literally filled with gold, and which is separated by pounding in a mortar.

A lump of gold worth $205, was taken out from Binsley & Co's claim, on Kentucky Flat, a few days ago.

We saw, yesterday, a very rich specimen of gold bearing quartz taken from a ledge near the mouth of Wolf Creek, opposite Snow Point. A company was formed and claims located. The ledge is about three feet wide and so far as prospected, is remarkably rich, and pays them handsomely for working it in a hand mortar.

Copper.—The *Gazette* says:

We learn that the locators of the first northerly extension of the Fox copper ledge have been offered $70,000 by some San Francisco capitalists for their location. The location consists of ten claims of one hundred feet each.

Five or six companies have located claims upon the Hermitage, a ledge 400 yards west of the Fox ledge.

A piece of quartz weighing one pound, and valued at twenty dollars, from Grizzly Hill, was shown to the *Gazette*, who adds that tons of the same are now in sight—the ledge being three feet thick.

Placer County—

The miuers of Gold Run were about holding a meeting to determine what course should be pursued in order to rescue their mining claims, which happen to be on the reservation of the Central Pacific Railroad Company, from the clutches of that grasping monopoly.

The following is from the Dutch Flat *Enquirer:*

Messrs. Judd, Kinder & Stewart, composing the Gold Run Company, lately cleaned up $2,700, after a run of twenty days, ten hours per day, with 300 inches of water.

Plumas County—

An East Branch correspondent of the Quincy *Union*, gives the following items:

The Taylor Hill Company are not working their claims this season, but they are selling all the water their ditch can carry.

The Bunker Hill Company have plenty of water, and the opening in their claim is growling large very fast. McElroy & Co., on the beach above Long Bar, are doing well. Butler & Co's claim, at the Junction, prospects as well as ever; they have one of the best claims on the river. The Pea Soup Co. are at work "bottoming" up, and are getting good pay.

Shasta County—

Noah S. Batcheller, who arrived in the country on April 4th, recollecting the quartz which he saw in Shasta County, in 1851, proceeded directly to the vicinity of Ellsworth's saw mill. He "struck it"; and located three ledges, which he named the "Chicago Series." The news of the discovery spread like the wind," says the *Courier*. The editor of that paper visited the ground, and picked up a piece of the rock, which seemed to be all alike, and had an assay of it made in town. The result makes the value $525 to the ton, in silver. It was not tested for gold, although it is thought to be rich in that metal also. A new district was created and named the "South Fork."

The same paper, speaking of the Washington Quartz Company, says:

During the space of a year, the mill has crushed 1400 tons of rock, from which the company have received $15 per ton in coin over and above all expenses for melting, assaying, brokerage, express charges, etc.

Sierra County—

The Downieville *Messenger* of May 12th, has the following items:

Jim Messerve has sold his share (one half) of his lately discovered quartz ledge, to an Eastern company for $1,000. We understand the purchasers are the same who purchased the Wheeley ledge, and which is now being worked by them.

From the hydraulic mining camps we hear that the water has nearly failed with most of the companies, and though it fails early, the yield of gold has been unprecedented. At Eureka, we hear the water cannot hold out more than a couple of weeks, and it is probably the same elsewhere. Many of the diggings will return a net profit of double their former yield, and money will be more plentiful than for several years.

A correspondent at Alleghany says Gov. Newell is below and report says he intends putting up a new mill on his return. The Twenty-one Company will soon erect a new mill with a hardy gurdy wheel, running four stamps, with capacity for more. The General Sherman ledge, owned by Bob Waters, prospects well. The Oak Flat Company still continue to get encouraging prospects and intend to start their mill soon. The Fac Simile Company have resumed operations. The Union Company are running their mill with encouraging results. Rice, Wright & Co., are resuscitating the old Fremont Company, which will doubtless prove highly remunerative. The Masouio is repairing and consequently working only one-half their force. Their prospects are cheering.

Messrs. Cole & Stevens, of Brandy City have just completed the building of two or three miles of mining sluices. The Marysville *Appeal* says that last week they cleaned up two of the upper flumes and took out 420 ounces of gold.

Tehama County—

The Red Bluff *Independent* saye:

Fuller & Larkin have been awarded the contract to sink a shaft on the Union Company's works at Lower Springs.

The emigration is coming thick and fast to start from this point to Idaho.

Trinity County—

The *Journal* of the 12th inst., says:

We have the most reliable authority for stating that the gold of Canon Creek will be very large this year—much larger than it has been for several years past. The ditches owned by Jos. Depinett, Flowers & Co., Major Price and Adam Berger, are flowing full of water. The new tier of claims lately opened along the hillside below town, are paying well. Mark Knowlton & Anstead are taking out a hundred dollars a week, and other claims pay regularly from $6 to $10, and an ounce a day to the hand.

Wm. O'Brien and Joseph McIlvane started from Weaverville for the Atlantic States on the 2d of May. They had been mining on New River during the past winter, and the amount realized, added to that for which they sold their claim, reached the snug little sum of $5,300, which they carried with them in New River dust, the particles of which varied in value from 50 cents to $50. On the 5th of this month Steve Noble, Albert Prnett and John Keach, sold at Creenhood's Bank a pint dipper full of the same kind of dust. Four pieces of this last lot weighed over $500—the largest being worth $199.

Tulare County—

The Keru County correspondent of the *Times* says:

New quartz discoveries are of daily occurence, and rock that will not "horn out" at the rate of forty dollars per ton is passed by with contempt by the prospector. Among the lodes opened and paying I may mention that of Mills, McDonald & French, Parsou Higgins, Tucker & Collins, all worked by arastras, and, especially the lode first mentioned, paying well. The Long Tom mine, owned by the Roberts Bros., is, I am informed, paying large profits. This lode is from six to nine feet in width of solid gold-bearing quartz. The main and air shafts, about forty feet apart, are down about one hundred and twenty feet. The company have a ten stamp steam quartz mill crushing day and night. A quartz mill to do custom work is much needed here.

The "Pinte," is a new district, three miles east from the Hot Spring Valley. Rich prospects have been found.

The Visalia *Delta's* Inyo correspondent sums up thus:

Captain Almarin B. Paul's mill will be running before this reaches you. The Pioneer Mill will be in operation in a very few days. The Kearsarge Company's Mill is also nearing completion. There is a enough rock in sight to run a twenty stamp mill a year. The Chrysopolis Company are working about twenty men on mill and mine. Colonel Stevens, with a stiff force, at the head of Owen's Lake, is going ahead prospecting the A No. 1 ledge, and exoresses himself as more than satisfied with both ore and ledge. Prospecting is still going on, and new discoveries are constantly being made. Some of the rock of Fish Spring district is now being worked in the mill of Thomas Passmore.

Tuolumne County—

The following items are from the *Courier:*

A 5-stamp mill, with capacity for ten stamps, will at once be erected on the Starr King claim near the Grizzly.

Silver ore from Columbia district yielded by assay, 116 ounces to the ton.

A 10-stamp mill has just been completed for the Mississippi vein, at Oak Flat.

The same paper says: Placer mining is carried on in and around about the city of Columbia to a greater extent than most people throughout the county dream of—in fact, it may be said that the placer mining of the county is centered now up in this district.

Yuba County—

The mines at Brown's Valley are again coming into favor. The Pennsylvania, Donebroge, and Yuba will be crushing rock in the course of three weeks. The Jefferson company is still taking out rich rock, and mining interests generally are improving.

Smartsville is said to be to Yuba, what Grass Valley is to Nevada county.

NEVADA.

Virginia—

A company has been incorporated, represented by Messrs. Pray, Clark and Goff, to construct a flume from the east side of Lake Tahoe, through the heart of that timber region to Empire, a distance of fourteen miles, for the transportation of fuel for the mills. The Gold Hill *News* says: "If they come up to a third part of their expectations in regard to quantity to be delivered, a great reduction in the price of wood and lumber must necessarily take place. A reduction of price leads of course to a closer working of our ores, an advantage gained that our mine and mill owners well understand. Success to the enterprise, say we."

Reese River—

The Nye County *News* of the 5th inst., has the following: From Mr. A. J. Holmes, who came in on Thursday last, from Columbus district, we learn that things are progressing finely in that section. He reports the mines looking well, and says it is the intention of the company with which he is interested to put up a 20-stamp mill immediately.

The amount of ore shipped by the Succor mill during the week, amounts to 2,305 ounces, valued at $2,132.83.

The *Reveille* of 10th inst., says: "This morning Messrs. Sinclair and Pickett called at our office with a number of samples of the richest copper ore just discovered in the Battle Mountain district. Nearly every piece showed native copper. There were green carbonate, silver fahlerz, or gray copper ore, of light steel gray color, and red oxide of copper, holding incrustations of malachite, beautifully banded. Probably no richer copper ores can be produced on the coast.

A new district, the Palmetto, has just been organized. It is on the southern boundary of the State, adjoining California, and is twenty-five miles south of Silver Peak. Fifty-two

locations have been made. The *Reveille* says: "The veins are all silver bearing, with perhaps a trace of gold, and the specimens brought in indicate mineral of a superior character, and we predict they will assay largely.

A little over six tons of ore from the Yankee Blade, produced three bars of bullion valued at $3,950.

So great a volume of water has recently been tapped in the Oleander mine on Lander Hill; as to drive out the workmen and temporarily stop its further working.

The New York and Silver Peak mining company have stopped work for the present, owing to defective furnaces and imperfect machinery. They will discard their Gardiner Crusher and Little Giant engine, and replace them immediately by a 20-stamp mill and a powerful engine.

Esmeralda—

The *Union* has these items:

The news from Bodie this week is decidedly flattering. The Empire mill is crushing rock which pays well, and the mines of the company give promise of an abundant yield of good ore. The Homestake is also busily engaged crushing rock of a superior quality.

The New York company, at Silver Peak, has suspended operations, and they will be compelled to remain idle till new machinery can be procured. The reason assigned for the suspension is, that the Thunderbolt Crusher which they erected in their mill has proved a failure. [We predicted this.—Eds. Press.]

The Challenge company, at Columbus district, took a ton of ore from the Plata ledge some time ago and had it worked by a mill at Dayton, from which they received the very satisfactory return of $324 in silver and $15 in gold.

Humboldt—

The *Register* has the following items:

The Seminole tunnel is now in 94 feet, and rock so much improved that greater speed is making than formerly. Superintendent Davis showed us rich croppings from the Seminole ledge, taken at a point 700 feet above the tunnel level. Balhach made an assay of an average of these croppings, showing a value of $82 40 in silver to the ton of rock.

The Silver Bullion Series, Indian district, is coming out a fine claim.

The Monroe company continues the work of development, and that ledge of fine auriferous quartz gradually widens as depth is attained.

The Pioneer company, in this district, John C. Fall, agent, is driving ahead with work in the Chameleon and Inskip claims. Prospect in the Chameleon good. The Pioneer mill, in the hands of Mr. Torrey, has been put in excellent working order, and is prepared to run day and night—batteries and pans—if the supply of rock is sufficient.

George Faulkner, one of the owners of the Sheba mill and mine, is back from the Bay, and making preparations to start the mill. He has some hundreds of tons of Sheba ore, some of Yosemite, and expects considerable quantities from the De Soto.

The Essex claim, adjoining the Empire, is prospecting well under work, and the owners are pleased with its appearance—thinking it will prove as good as the Empire.

The Nevada.—The contractors last week completed their work in this claim, but closed short of the ledge. The company has resumed work, expecting to put the tunnel in about 25 feet further. All the miners' signs indicate an early strike.

Col. Silver, of the Empire Tunnel claim, is now in San Francisco making his arrangements for a mill that will crush 25 tons of ore per day. A mill site below Dun Glen, commanding a plenty of water for steam purposes and convenient to the mine and to wood, has been secured.

Sultana Series.—Roots has his working shaft in this claim about 90 feet deep—still sinking, and expecting soon to strike the upper wall of the first ledge.

ARIZONA.

Five hundred ounces of gold dust from the Linn's Creek and Weaver district placer mines, and a considerable amount of gold from the Vulture lode, were brought to Los Angeles by Mr. Goodwater recently. Some of the placer nuggets are worth one hundred dollars each. Mr. G. brought also some silver bricks from the Patagonia silver mine, belonging to Mowry & Co.

IDAHO.

The *World* of April 28th, says: The ditches are now full of water, and the mining community are busily at work. Very few idle men are to be seen on the streets. The claims in Elk and Moore's creeks still afford work for a large population, and the banks of both streams are rapidly caving in under hydraulic pressure. The claims on the bars heretofore neglected are generally paying better than even their sanguine owners anticipated. The supply of labor is nearly equal to the demand, though in some localities more men are wanted than can be found. Wages continue at six dollars per day, and seven dollars per night.

OWYHEE.

The Ainsworth mill, on Sinker creek is to be overhauled and thoroughly repaired. A new double turbine wheel is to replace the old arrangement, and the steam works are to be fitted up also. The *Avalanche* of 21st April says: "The company are vigorously prosecuting work on the Surplus ground of the Oro Fino, and have already considerable pay rock out at the mine, and to facilitate the work, have erected a whim for raising water and rock. All things considered, the Sinker mills have a scene of prosperity not far ahead."

"A large number are preparing for extended prospecting for many miles round, making Owyhee headquarters. Discoveries are daily reported."

The same paper says of the Adriatic: "The ledge bearing this name lies across at the mouth of Coffee Gulch—one mile west of Silver. Upon an examination, last week, we found a tunnel in the first extension south, and a shaft down twenty feet. In the tunnel the ledge was a mere seam, and at the bottom of the shaft fully six feet wide and increasing very fast. Assays of the rock range from $28 to $900 per ton."

Freight from San Francisco to Owyhee is now only fourteen cents per pound! This is via the Sacramento river and Pacific railroad.

MONTANA.

The Pen d'Oreille route is open for pack animals. The *Radicator's* correspondent at Jefferson Gulch, says: "The result of the past two weeks mining has surpassed the most sanguine expectations.

I have seen a nugget taken out today by Frank Ireland & Co., that is valued at $276 25, the largest one found in this gulch I believe.

Mr. Wate in digging a drain ditch to his claim picked up $1,060 without sluicing or washing the dirt.

Mr. Martin on the claim immediately adjoining the one above mentioned, rocked out $54.89 in less than two hours with a small hand rocker and no one to help him. Messrs. Gunsaulis & Co., in the lower district, have struck upon very rich deposits in their ground with prospects varying from three to five dollars to the pan of dirt. Messrs. James Ware and Allen, I am informed, have the richest claims in Barris district, yielding from twenty-five to fifty and even as high as one hundred dollars to the pan of dirt.

In regard to quartz lodes I have but this to say, that there have been quite a number found in the upper district, none in the lower that I know of. Among them are the Montana, Grey Eagle, Luella, Emma Davis, Divide Lode, etc. How rich these ledges are I am not prepared to say. There will be two mills erected here the coming summer."

James Kennedy, expressman from Blackfoot City to McClelland gulch, informs us that the gulches in that vicinity are turning out much better than the most sanguine anticipated. McClelland has been mined all winter. Lincoln gulch has proved a success; the gulch generally pays well. One party has been offered $4,000 for a third of the dirt taken from one drift during the winter.

OREGON.

The Dalles *Mountaineer* of May 4th says: Two hundred and forty pounds of quartz taken from Columbia ledge, near Vancouver, assayed $26.29 of gold and silver. The rock was not selected, but taken from a quantity thrown out by a blast sunk two feet in the ledge.

Mr. W. H. Farrar has just finished working five hundred pounds more of the Vancouver quartz, the result of which was assayed by King, Myrick & Co., and a good return is shown. Placer diggings have been found that pay well, in the vicinity of the ledges, which is about fifteen miles north of Vancouver.—*Oregonian.*

BRITISH COLUMBIA.

The road to Big Bend was opened at last accounts. Those from California and elsewhere, who had gone via Victoria, had arrived at the diggings; while those who wintered at Colville, or who had attempted to go up via Portland and the Columbia river, had not yet been able to reach their claims.

COLORADO.

The following are from the Colorado *Journal*:

We are told that some parties owning the Barker lode in Eureka, and who have had it bonded some two years, are now clearing $1,000 a week by working it and selling their ore to the Lyon Smelting Works.

There is more real excellent ore moving in different directions just now than for a long time before. Keith has the pressing offer of perhaps one hundred cords at $300 to $350 a cord. Everybody wants a test of his ore before building one of the furnaces.

Mr. Adams has the finest show for ore in the Burlington lode we have ever seen. A shaft one hundred and sixty feet in depth, and a drift of one hundred and ten feet long, both all the way disclosing a fine crevice. He is giving the C. & T. Desulphurizers a fair trial, preparatory to adopting Keith's.

The Denver *News* of April 25th, says: We looked at the little lump of bullion from Lynn's works last evening, at the express office. It weighs eighty pounds, twenty-five per cent. being gold, and the balance silver, and is worth in coin value, about $6,500. This piece of bullion, from Gregory ores, is the product of one of Lyon's furnaces, the other undergoing repairs.

GEORGE E. BROWN,

(Late Assistant Examiner in the U.S. Patent Office,)

HAVING RESIGNED THAT POSITION AFTER A TENure of office of eighteen months, offers his services to

INVENTORS AND THEIR ASSIGNEES,

—AS A—

Patent Solicitor,

He will make Preliminary Examinations in the Patent Office, with a view to ascertain the Patentability of any invention that may be submitted to him for that purpose; will prepare the necessary papers for those who wish to make Applications for

Patents for their Inventions,

—OR FOR—

EXTENSIONS OR REISSUES OF PATENTS

Already granted; will act as an Attorney in presenting Applications at the Patent Office, and in managing them to a final issue; will draw up Assignments; will examine into the condition of Rejected Applications when desired to do so, and undertake the prosecution of such as may be considered patentable, and do whatever else is usually done by Patent Solicitors.

Address, P. O. Box 257, Washington, D.C. 7v12-3m

City College Laboratories,

Southeast Cor. Stockton and Geary sts.

Practical and Analytical Chemistry and Metallurgy.

THOMAS PRICE,

Professor of Chemistry,

(Formerly of the Normal College, Swansea.)

WILL GIVE PRACTICAL INSTRUCTIONS IN QUALItative and Quantitative Analysis and Assaying. The course qualifies students for the application of Chemistry to METALLURGY, MANUFACTURING ARTS, and MINING PURPOSES

PHARMACEUTICAL and TECHNICAL CHEMISTRY, such as is required by Medical and Pharmaceutical students, will be taught to such students as may require it.

Course of General Chemistry.

Evening Lectures will be delivered every Tuesday, at half past seven o'clock, P. M., in the Philosophical Hall of the College, without extra charge to the students in the institution.

On and after the 14th of February, the Laboratories will be open every day, except Sundays, from 8 A. M. to 5 P. M. For further particulars, address

REV. P. V. VEEDER,
Principal of the City College.
Or at 406 California Street.
6v12tf

SANTA CLARA COLLEGE, S. J.,

SANTA CLARA, CAL.

Conducted by the Fathers of the Society of Jesus.

The FIFTEENTH ANNUAL SESSION of this College will commence on

Monday, August 28th, 1865.

TERMS—Tuition in the Classical and Scientific Department; Boarding and Lodging; Washing and Mending of articles Washed; School Stationery; Medical Attendance and Medicine; fuel, light, baths, etc., per session of ten months..... $350

For further information and catalogues, apply to the President of the College, or to Rev. A. Maraschi, St. Ignatius College, Market street, San Francisco.
3v11 REV. A. MASNATA, S. J., President.

SACRAMENTO SEMINARY.

BOARDING SCHOOL

FOR YOUNG LADIES,

Tenth Street, between F and G,

SACRAMENTO, CAL.

Session commenced January 8, 1866.

It is Impossible for editors to know ALL the merits and demerits of their correspondence, consequently the reader must not receive the opinions of our contributors as our own. Intelligent discussion is invited upon all sides and the evidence of any error which may appear will be received in friendship and treated with respect.

American and Foreign Patents.—Letters Patent for Inventors can be secured in the United States and foreign countries through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past two years.

Favorable to Inventors.—Persons holding new inventions or machinery and important improvements, can have the same illustrated and explained in the MINING AND SCIENTIFIC PRESS, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

Payment in Advance.—This paper will not be sent to subscribers beyond the term paid for. The publishers well know that a good journal cannot be sustained on the credit system.

Mr. Wm. R. Bradshaw, is our Special Correspondent and Traveling Agent. All favors or assistance rendered him in his progress through the country in behalf of our journal, will be duly acknowledged.

SAN FRANCISCO, Jan 1st, 1866.

Mr. A. C. Knox, is our fully authorized Traveling Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office.

SAN FRANCISCO, Jan 11th, 1866.

Mr. I. N. Hudson, is authorized to solicit subscriptions, advertising, etc., for the MINING AND SCIENTIFIC PRESS, in San Francisco, and to receipt for the same.

Mr. S. D. Woods, will correspond and act as Agent of the MINING AND SCIENTIFIC PRESS in the Interior.

San Francisco:

Saturday Morning, May 19, 1866.

A VALUABLE MINE.—We learn from a very reliable source that Hayward's mine, on Sutter Creek, Amador county, netted to Mr. Hayward, the fortunate and sole owner, the nice little sum of $47,000, for the month of April last. Mr. Hayward has two mills upon this mine—one of 16 stamps and the other of 40. The 16-stamp mill is said to pay all the expenses of mining and crushing for both mills, leaving the total earnings of the 40-stamp mill as clear profit. This mill is thoroughly cleaned up once every two weeks, with a very uniform result, ranging from $21,000 to $23,700 per clean-up. The former is the lowest and the latter the highest amount yet realized for a two-weeks' run. Six years ago this mine was not paying expenses. It was then worked but a short distance below the water level. Their deepest shaft is now down 1,110 feet. This may be put down as another result of perseverance in mining, and additional evidence of the importance of following our quartz mines down to a lower depth than has heretofore been generally attained, before we pronounce them failures.

A VALUABLE MINE.—Bullion to the amount of $22,000 was recently taken out of the rock obtained while sinking a shaft one hundred feet deep, and eight by six feet in size, on the Long Tom mine, situated about eighty miles south of Visalia, in Tulare county. The mine is owned by Geo. D. Roberts & Co. They have a 10-stamp mill on the same, and are now prosecuting the work of development by drifting from the bottom of the shaft. The rock, so far as they have gone, looking equally as well or better than in the shaft. A 20-stamp mill was shipped from the Union Foundry, in this city, about two weeks since, for the Mammoth Mining Company, on Kern River, ten miles this side of Clear Creek. This is an old mining property, and consists of several independent mines, all of which have recently passed into the hands of a new company. The principal lode has been worked upon the surface for a distance of about 2,000 feet, averaging from four to fifteen feet in thickness. The present owners are Geo. D. Roberts, A. W. Baldwin and O. A. Sanborn.

TO MINE OWNERS.—A young man, a graduate of one of the European mining schools, is desirous of employment by some mining company. He comes well recommended and refers to Riehn, Hemme & Co., assayers of this city. See advertisement in another column.

A BOOT NAILING MACHINE.

Mr. E. T. Barlow, of this city, has submitted to our inspection a machine of his invention, designed for nailing boots or shoes. The machine takes a small coil of wire into its embrace, and with the boot or shoe firmly placed upon an iron last, makes its nails as they are driven. The nails are forced firmly and squarely into the leather, and headed upon both sides by the upsetting power of the machine. It can be set to make and drive any desired length of nail from a sixteenth of an inch to a foot or more in length. If the nail, by any small inaccuracy in setting the machine, happens to be a trifle too long for the thickness of the leather designed to be fastened together, the excess of length is taken up by upsetting or kinking, which latter always occurs in the center of the leather, at equal distances from the two points of contact. The sole of the boot is readily directed by adjustable guides, and the nails may be driven at any distance apart, so that the same machine may be used for both the finest or the coarsest work. The machine is also applicable to harness or any similar work, or for nailing small boxes, such as cigar boxes, etc., where great accuracy or speed is desirable in driving the nails. The entire machine is so simple in its construction that it may be operated by a child, and may be driven by hand or the application of power. It is worked by a crank or by pulley motion. Only one other machine devised for this kind of work has ever been invented, and that is a French invention, which was exhibited for a few days during the last Fair of the Mechanics' Institute. There are many defects in that machine which are entirely obviated in this, to say nothing of the fact that Mr. Barlow will be able to sell his machine for less than half the price of the French invention. Mr. B.'s machine will work two or three times as fast as the French, and requires no after finishing as is the case with that. The French machine, we are informed, is not allowed to be manufactured in this country; the inventors holding patents both here and in Europe, manufacture in France only. This machine may be seen in operation on and after Monday next at the residence of the inventor near the Railroad Machine Shops on Brannan street.

BLAKE'S CRUSHERS.—This Pioneer Crushing Machine appears to be fast winning its way to public favor. Captain Lee, of the Empire Mill Grass Valley, has had one of these crushers, the largest size made, forwarded to his new mill from the Union Foundry in this city. Last week two of these machines were sent to Gold Hill, Nevada, one of which was for the Crown Point mill. The Crescent mill company, at Indian Valley, Plumas county, had one of these rock crushers put up in their mill last fall. They say that it daily saves the labor of twelve men, or over $10,000 per annum. One of these machines is also used at the Gould & Curry mill in Virginia City, where it saves a vast amount of labor previously employed in reducing the rock to the size necessary for feeding to the batteries of their immense mill. A similar result is reported of its working at Birdsall & Carpenter's mill at Dayton. These machines are manufactured at the Union Foundry in this city.

PIONEER TYPE FOUNDRY ON THE PACIFIC COAST.—Messrs. Wm. Faulkner & Sons are engaged in preparing an additional story to their establishment on Clay street, for the purpose of opening the first regular type foundry on the Pacific Coast. We presume it to be the first manufactory of the kind west of St. Louis, if not the only one west of Cincinnati. It will be a branch of James Conner & Sons' United States Foundry, New York, for which firm the Messrs. Faulkners have been agents for some ten years. Four or five workmen are now engaged in the East in manufacturing the matrices and other utensils necessary for a complete foundry. This new and important branch of manufacturing is expected to commence operations by August next, which event will be hailed with much satisfaction by the printing fraternity on this Coast, which has long felt the necessity of such an institution.

NEW PUBLICATION.

THE MILLER'S, MILLWRIGHT'S AND ENGINEER'S GUIDE. By Henry Pallett—Illustrated. Philadelphia: Henry Cary Baird, Industrial publisher.

The author of the above work appears to be a practical man, and, according to his preface, he has devoted much time to personal investigations in regard to the subject upon which he treats, having traveled through most of the States of the Union for the purpose of observing the various manners in which different millers manage matters in the various establishments under their care. The idea is a good one, and might be most advantageously carried out by individual mill owners among the quartz mills of the Pacific coast. It is obviously advantageous to a millman to move about at a distance from his own locality, and observe the practice of those perhaps more experienced than himself; else he will never be able to improve on what may possibly be the very imperfect milling of his own immediate district. The work before us is more especially intended for persons engaged in flouring mills; but contains much information of value to millmen everywhere, and should be in the hands of every mechanic. For sale by Roman & Co., of this city.

THE BIG TREE OF CALAVERAS ECLIPSED.—It is stated that Mr. Throckmorton, who owns a rancho embracing some 20,000 acres, in Marin county, has recently discovered a stump on his grounds which takes the palm from the big trees of Calaveras county. This stump is 52 feet 5 inches in diameter, and is now used by Mr. T. for a corral. The T. Starr King, the biggest of the Calaveras grove, is only fifty feet in circumference, and the big stump covered by the Stump House but seventy; while the stump on Mr. Throckmorton's ranch, if the above report is correct, must be nearly 160 feet in circumference. It may be that a slight error has been made in the report by substituting diameter for circumference. We should be pleased to hear from any one who has personal knowledge of the existence and size of this newly discovered mammoth relict of a primeval forest.

THE BUCKEYE FLOUR MILL.—This mill, situated at Marysville, is one of the largest and finest mills in the State. The engine is 140-horse power, driving four run of stone, which grind 300 barrels of flour every twenty four hours, besides ten tons of corn and thirty of barley. So perfect is the working of the engine, that the amount of fuel necessary to twenty-four hours' grinding, is only six cords of wood. The present mill was built in July, 1865, and has been in constant operation since. A large and commodious storehouse, two stories high, and capable of holding 600 tons of grain, is to be added during the summer. It is to be constructed so that grain can be stored in bulk, thereby saving a large amount of labor and expense for sacking. The mill is owned by A. D. Starr. The engine, which has the largest driving wheel in the State, was built by Prescott & Scheidell of the Marysville Foundry.

THE MARYSVILLE FOUNDRY.—This foundry, situated at a central point of communication with the northern sections of this State, and the States and Territories beyond the Sierra, is prepared with all the appliances and facilities of furnace and mouldings to fill all orders from the construction of a simple shaft, to the finish of the largest mill. Many large and flourishing mills, both flour and quartz, in this State and the most distant Territories, attest the skill connected with this foundry. Engines from ten to one hundred horse power, are built at the shortest notice. The skill and experience of the proprietors has gone far to make it one of the best foundries on the Pacific coast. An experienced draughtsman, familiar—by constant study of new models and inventions—with all the valuable improvements in machinery, lends his skill to the reputation daily achieved by the successful operators of the foundry. Messrs. Prescott & Scheidell are the proprietors—names that carry evidence of success.

A WATER QUERY.

MESSRS. EDITORS:—A hydraulic wheel, (Frendenburr's, for instance), two feet in diameter, with sixty inches of water and one hundred feet head, will give a certain horse-power; now, if the wheel is increased in size to four feet in diameter, the other conditions remaining the same, will there be an increase of power?

L. H. L.

Pioneer City, Cal., April 11th, 1866.

Theoretically there will be none, or if any, very slight. For the quantity of water and head given, practical mechanics say that the two-foot is sufficiently large. The size of the wheel may perhaps depend somewhat upon the required motion of the machinery to be driven. Convenience, therefore, is an element not to be overlooked. The velocity of the buckets in each case being the same, it is evident that with the same supply velocity of water, the two-foot wheel will make two revolutions to one revolution of the four foot wheel. And on this account the friction of the smaller wheel is some greater than in the case of the larger. Therefore to answer this question more practically, it is necessary to know all the facts. We have answered as if the quantity of water was taken at sixty inches under a six-inch head, and then applied to a Frendenburr's Wheel, the fall being one hundred feet.

DID NOT SUCCEED.—We understand that the Crosby & Thompson's desulphurizer, which was recently put up at the Enterprise company's mine, in the Meadow Lake district, Nevada county, has not proved a success. It is said to have worked well for awhile, but soon burned out. We have heard it intimated that the machinery was faulty in construction, and that with certain modifications there is reason to believe it might yet be made a success. We should be pleased to receive a more particular account of the trial, and learn more fully the exact nature of the defects noticed, and the modifications proposed.

NEW CONCENTRATORS.—Five of Hendy's Improved Prater Concentrators were forwarded from this city, last week, as follows: Three to the Benton mill, and one to the Bear Valley mill, Bear Valley, Mariposa county; one to the Gold and Silver mining company's mill, near Newcastle, Placer county. Two of these machines are now building at the Pacific Foundry, for the Triunfo company, Lower California and another at the Fulton Foundry, for the Louisiana company, Mariposa county.

PACIFIC COAST BUSINESS DIRECTORY.—Henry G. Langley, the enterprising publisher of the San Francisco City Directory, announces the early publication of a comprehensive business directory for the Pacific Coast. Works of similar character are now sustained in seventeen of the Eastern States, and it is believed that a directory for this Coast can be made an important medium for dissemination of valuable information connected with the business facilities of our own merchants, manufacturers and others. For a really practical and useful work of this description, we know of no party who could undertake with better chances of success than Mr. Langley. See his advertisement in another column.

A MINING BUREAU FOR MONTANA.—We have received from the Secretary, Mr. Francis C. Deimling, a copy of the prospectus of the *Mining Bureau of Montana*, with the rules and regulations and names of officers and members. The object of the association is to provide some reliable source for the dissemination of reliable information with regard to the mines and mineral resources of that region. The institution is in a position where it can be made an instrument of great good, and if it is managed by competent and reliable men, it will doubtless prove a valuable medium for the dissemination of useful information.

COLOR-BLINDNESS is not a disease of vision but rather a remarkable condition of vision. Dalton discovered his color-blindness by hearing a geranium called red which he had thought a light blue. Dugald Stewart could not tell a cherry from its leaves except by the form.

BUSSEY'S LOCK.—Next week we shall give a description of this new and effective burglar-proof lock.

NEW FOUNDRY.

A NEW ENTERPRISE AND HOW IT WAS INAUGURATED.—On the corner of Tehama and Fremont streets have lately been erected several large buildings by Messrs. Hanscom & Co., as the foundry and machine shops of the Ætna Iron works, of which they are proprietors. On Tuesday last we received an intimation that on that evening the new works would be dedicated; so we drifted out that way soon after nightfall, and were surprised to see the large building intended for the pattern and machine department, brilliantly lighted up, and on entering to behold in the lower room, which was gaily trimmed with flags and streamers, two long tables loaded with a tempting display of dainty and substantial viands, and ornamented with beautiful boquets of flowers; and in the upper hall—a room 40 by 75 feet, to meet not less than 250 people, either dancing to the cheering music of Willis' band, or happy lookers on of the scene.

The dance went on till midnight, when the merry throng adjourned to the dining hall to partake of the rich and bountiful repast spread before them, after which they again assembled in the hall, to properly close the dedication services, and to deliver over the building to the Spirit of Industry that is hereafter to preside there. Everything went on as "merry as a marriage bell," and all pronounced it the grandest surprise party of the season.

It seems not out of place here to say that this enterprise is started by men possessed of energy and a thorough practical knowledge of their business. They are prepared to turn out light or heavy machinery in the finest manner. In their moulding and finishing departments everything is of the latest and most improved designs, and their workmen are as skillful operatives as can be procured on this coast. Their workshops are commodious, well lighted and well ventilated. The buildings are all made in a firm manner and with careful reference for convenience. The machine shop is two stories in hight, fronting seventy-five feet on Fremont street, by forty-five feet in depth; engine house, seventeen by twenty-six feet; blacksmith shop, twenty-five by twenty-five feet, and the foundry, forty by fifty-five feet. A McKenzie blower is used with the furnace. The capola has a capacity for melting six tons of iron per day. A 16 horse power engine drives the machinery. Having long known two of the young gentlemen comprising the firm, we take pleasure in saying they are worthy of the success they seem bound to win by the substantial and enterprising manner in which they have commenced operations.

PAPER FROM WOOD PULP.—A despatch dated Philadelphia, April 12th, says:

A large number of capitalists, journalists and gentlemen of scientific renown, gathered here to witness the process of making paper out of wood. The company owning this process have established large works on the Schuykill river, near Philadelphia, where there are accommodations for making twenty tons of wood-pulp paper daily. They are owned by capitalists from all parts of the country, who witnessed every detail of the process. The company have achieved a great success. A poplar tree taken from the hillside was converted into clear, white, soft paper in the space of five hours. In the evening a banquet was given by Messrs. Jessup & Moore, at the Continental Hotel. About 200 guests were present. The Mayor of the city, the Hon Morton McMichael, presided; and speeches were made by Horatio Gates Jones, Vice-President of the Historical Society; the Hon. Mr. Jencks of Rhode Island; Theodore Tilton of the *Independent*; Erastus Brooks of the *Express*, and many others.

THE EUREKA MILL at Grass Valley, cleaned up for the twelve days run ending May 5th, $29,700.

Occidental Homestead Association,

Office, 305 Montgomery street, San Francisco.

Capital Stock : : : : : : : $33,600

102 Shares, $330 Each.

THIS ASSOCIATION was formed to enable its members to obtain desirable homestead lots in this city, at a cheap and easy rate, paying for the same by regular monthly installments. For this purpose they have purchased blocks 499, 500, and 501 in the Western Addition to this city, bounded by Devisadero, Pine, Broderick and Clay streets. Subscribers will pay an initiation fee of $5 on each share taken, to form a fund for defraying current expenses, and $11 per month for thirty months, commencing in April, 1866. The property is within three blocks of the Turk Street Railroad, is nearly all on the grade, and is most desirably located for homestead purposes. It is directly east from the lands of the California Homestead Association. The property has been purchased on very reasonable terms, and offers a rare opportunity for investment. A number of fine houses are in process of erection, and streets are being graded near this property, which will greatly increase its value.

When twelve monthly payments have been made, the property will be divided among the members in the usual manner, and each shareholder will receive a contract for a deed to the lot or lots to which he may be entitled, and have the privilege of taking immediate possession of the same. The lots average 27 feet in front by 120 feet in depth. The whole amount due upon any lot may be paid at any time, and discount at the rate of 1½ per cent. per month will be deducted therefrom. Persons wishing to visit the lands of this Association will take the Turk street cars to Devisadero street, and thence go northerly along Devisadero to Pine street.

$20,000 of the capital stock is taken, and the books are open for subscription to the balance, at the office of the Secretary, where the Official Map of the Association can be seen, and all particulars obtained.

The Title to this property is perfect.

J. S. LUTY, Secretary.

Office 305 Montgomery street, corner of Pine, Rooms 2 and 6. 20v12 tf

FLORENCE

SEWING MACHINES!

COPY OF THE REPORT OF THE COMMITTEE OF AWARDS AT THE FAIR OF THE

AMERICAN INSTITUTE,

New York, 1865,

—TO THE—

Florence Sewing Machine Company,

FOR THE BEST FAMILY SEWING MACHINE.

HIGHEST PREMIUM—GOLD MEDAL!

REASONS:

1st.—Its simplicity and great range of work.

2d.—The Reversible Feed Motion.

3d.—The perfect finish and substantial manner in which the machine is made.

4th.—The rapidity of its working and the quality of the work done.

5th.—The Self-adjusting Tension.

The "FLORENCE" was awarded the First and Highest Premium at the State Fair of California, the only Fair on the Pacific Coast at which any two double thread Sewing Machines were exhibited in competition in 1865.

The "FLORENCE" received the only premium awarded by the Mechanics' Institute of San Francisco, in 1864 and 1865, to any Sewing Machine, Sewing Machine Company, or Agent. The claim of a competitor to a medal is without any foundation whatever.

Wherever the "FLORENCE" has been brought in competition with other Sewing Machines, it has always been declared the best. It is the most simple, the most substantial, the most efficient, and its use is easily learned. Every Machine sold is guaranteed in the full sense of the word.

Send for Circulars and Samples of Work.

SAMUEL HILL, General Agent,
20v12-14w 111 Montgomery street, San Francisco.

Rheumatism!!

READ IT! READ IT!!

SACRAMENTO, April 16th, 1866.

H. BOWMAN—DEAR SIR: THIS IS THE FIRST WRITing I have done in two years, and it affords me great pleasure to be able to use my pen in the service of those who are suffering, as I have suffered, by stating the following facts:

I have for two years and upwards been afflicted with CHRONIC RHEUMATISM, and until a few weeks ago I have never found anything that afforded me any relief. For three months of the time I was unable to feed myself, and for the last five months my arms have been so bent that I have not been able to dress myself. I was five months at the Warm Springs, at San Luis Obispo, and three months at a Hydropathic Institute in Stockton, and I have been under the care of six different physicians, in the vain hope of relief. About four weeks ago I was induced by a person who had been cured by it to try a bottle of RICHARD'S REMEDY FOR RHEUMATISM, and in less than twelve hours I experienced great relief. In a few days I was enabled to straighten out my arms, and I have been getting better and gaining in strength and flesh ever since. I have now the complete use of all my limbs, and, for the first time in two years, I am out of pain. I do feel for those who suffer as I have suffered, and if they will take my advice, they will lose no time in giving the REMEDY a trial.

Yours truly, GEORGE TAYLOR.

RICHARDS' REMEDY is for sale by

H. BOWMAN,
Druggist, Sacramento.
Price, $2 50 per Bottle. 20v12

PACIFIC POTTERY!

STONEWARE AND EARTHENWARE OF ALL DESCRIPtions, such as Butter Pots, Pickle Jars, Churns, Water Jugs, Bean Pots, Flower Pots, etc., etc., from the manufactory of N. CLARK, Esq., Sacramento—constantly on hand and for sale, in quantities to suit, by J. M. PAGE,
20v12 3m No. 42 Clay street, between Drumm and Front.

Our Circulation.—THE MINING AND SCIENTIFIC PRESS has a large and permanent subscription list, and enjoys a more universal circulation among stockholders and persons directly interested in mining than any other paper on this coast.

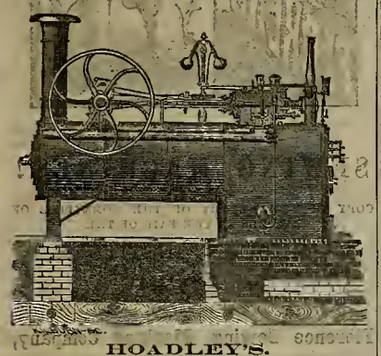
Portable Steam Engines!

"Hondley's" and "Hittinger's" Make,

HOADLEY'S.

FOUR SIZES,

8, 10, 12, and 15-Horse Power,



HOADLEY'S.

3 to 40-Horse Power.

HITTINGER'S.

THREE SIZES,

5, 7, and 10-Horse Power,

HITTINGER'S.

TWO SIZES,

5 and 7-Horse Power,

COMBINING THE MAXIMUM OF EFFICIENCY, durability, and Economy, with the Minimum of weight and price.

These Engines are favorably known a large number being in use on this coast for hoisting, pumping, threshing, milling and mining purposes

Steam can be got up on these Engines in fifteen minutes after reaching the place of operation, and the time, expense of setting boilers, machinery, and "construction account" saved, (which is often the difference between the successful and unsuccessful prosecution of milling enterprises,) in fact, the portable principle is the pioneer's friend, and enables him to draw engines on their own wheels to his cabin door, and plant on the outermost confines of civilization the saw and grist mill, and it has done and will do more to help subdue the continent than any other of the modern motors which are crowding society and normalizing the world

All sizes on hand from 3 to 30 horse power, with and without carriages.

Also, Portable Saw and Grist Mill's.

For sale by TREADWELL & CO.,
18v12 Corner of Front and Market streets.

EUROPEAN

METALLURGICAL WORKS,

—AND—

Practical Mining School,

Bryant Street, Between Third and Fourth,

SAN FRANCISCO.

THE Proprietors are at all times prepared to work or test Ores sent to this establishment—either in large or small quantities—by such process as may be found best adapted to their chemical character, after careful analysis has been made. Test lots of Ore adapted to the smelting process attended to. Sulphuret, pyritous, and the (so-called) refractious ores, are having especial attention paid to their successful treatment. Assaying in the humid and dry way. Also, refining by cupellation, done at moderate rates.

PRACTICAL MINING SCHOOL.

The proprietors—encouraged by numerous applications from gentlemen desirous of pursuing the study of practical metallurgy—have concluded to admit parties on reasonable terms. Having in their Mill all the necessary appliances for crushing, roasting, amalgamating, smelting, refining and assaying, as also a well extended Laboratory for the analysis of Ores and Minerals, a good opportunity is here offered to acquire a sound practical knowledge of the business.

Letter from Table Mountain.

MESSRS. EDITORS:—The Table Mountain, in Tuolumne county, has been often described, and I would not ask attention to another description, but for the fact that it opens to us a most interesting chapter of geological history. The mountain is an immense wall of hard, black lava, two or three hundred feet higher than the country on either side, with a level summit, as its name implies. It extends from Shaw's Flat, near Columbia, some twenty or thirty miles in a tortuous southerly direction. It is without doubt the product of volcanoes now extinct, situated a few miles above Columbia, and when fluid it ran down the course of an ancient river, filling its banks towards the valley of the San Joaquin, till it became congealed. The bed of this old river is now found far up the side of the mountains, and has been extensively worked by means of tunnels, with the usual success of river mining in California.

The point to which I wish to call attention is this: The once fluid mass of the mountain was walled in by the banks of the river. These banks must have been at least a hundred, and probably several hundred feet higher than the lava stream. Here and there may be found the junction of an ancient gulch, into which the fluid lava flushed back. But there are so few such places as to justify the inference, that the adjacent country was much higher than the lava. Now, what has become of it?

Some would say, "cut away by the ocean." But I find no marks of the ocean there so recent as Table Mountain. Yet, the old hills are gone that once covered Tuolumne county, at least three hundred feet above its present level, and even the bottom of the old river now overlooks the adjacent country. They are gone, and the method of their disappearance conveys some idea of the length of geologic periods. The storms of thousands of centuries have done the work. Each winter's rain brings down from the hillside a little sand, dissolves a little of the soluble particles of the rock and soil, and here we see the accumulated result. Rocks, soil and sand have all gone down the water courses to the sea.

The men who prospect for quartz never expect to find the veins crossing ravines, and it is almost considered a law of quartz veins that they "pinch out" at a water course. We may find the reason for this in the means by which the hills have been removed. The running water naturally carries away first the softer and more soluble rocks. Where it encounters a quartz vein, the thick out-croppings and hard wall rock will resist its action much longer than those places where the vein becomes thin. Hence, the waters make what may be called a "natural selection" at these points to break through the corner of a vein, and here the ravines are formed. Quartz veins pinch out at a water course, not because quartz shuns the water, but because the vein in its full size is better able to resist the action of the water.

J. A. JENNINGS.

San Francisco, December 22, 1865.

THE VALUE OF BOOKS.—Books are the windows through which the mind looks out. A house without books is like a house without windows. No man has a right to bring up his children without surrounding them with books, if he has the means to buy them. It is a wrong to his family. He cheats them! Children learn by being in the presence of books. The love of knowledge comes with reading, and grows upon it; and the love of knowledge in a young mind is almost a warrant against the inferior excitement of passions and vices.

Every child should have his little library, and learn to take care of and prize it. Parents cannot make a more profitable investment than to purchase a few useful reading books for their children; let them have a place for it apart from the general library, and call it their own. A child will read a book of his own with much more interest than he will a borrowed one, or one from his father's library, even. They may thus most readily be taught to love books, to take care of them, and become interested in reading them.

We always pity those poor rich men who live barrenly in great, bookless houses. Let us congratulate the poor, that in our day, books are so cheap that a man may every year add a hundred volumes to his library, for the price of what his tobacco and beer would cost him. Among the earliest ambitions to be excited in clerks, workmen, journeymen, and indeed, among all that are struggling up in life from nothing to something, is that of owning, and constantly adding to, a library of good books. A little library, growing every year, is an honorable part of a young man's history. It is a man's duty to have books. A library is not a luxury, but one of the necessaries of life.

ONE of our exchanges says: "Dr. Joseph Worcester, author of a dictionary, and inventor of Worcestershire sauce, is dead." Such is fame.

TO DREAM gloriously, you must act gloriously while awake; and to bring angels down to converse with you in your sleep, you must labor in the cause of virtue during the day.

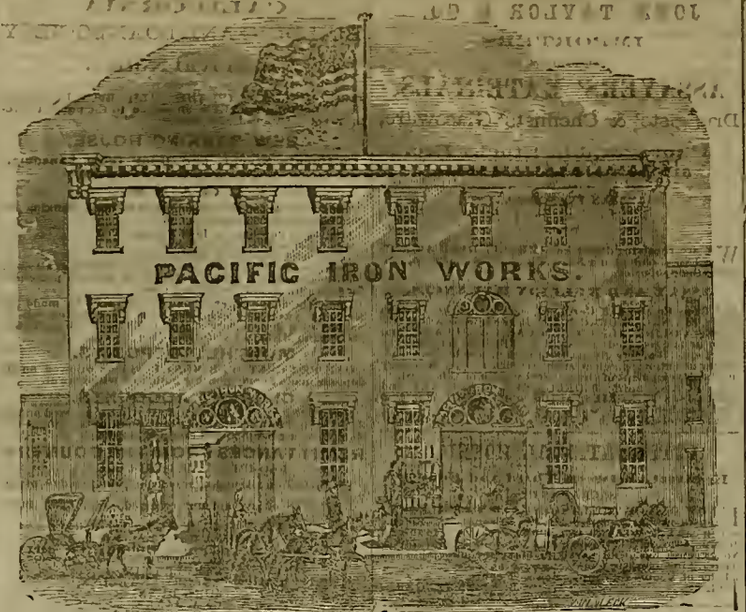
DEVOE, DINSMORE & CO.



THE PACIFIC IRON WORKS,

First & Fremont Sts., between Mission & Howard, San Francisco.

The proprietors of the above Works invite the attention of all parties interested to their greatly improved and unequaled facilities for manufacturing Steam Engines and Boilers, both Marine and Stationary, of any required size and pattern, Quartz Mills, Amalgamating, Pumping and Hoisting Machinery of the most approved construction. Flour, Saw, and Sugar Mills, Water Wheels, &c., &c. Our pattern list is most complete and extensive, embracing the late improvements in all classes of machinery adapted to use on this coast. We would call especial attention to the fact that we have secured the exclusive right of manufacture for the Pacific Coast of the celebrated Greene Engine, conceded to be the most economical and perfect working Engine now in use. We are also exclusive manufacturers of the celebrated

Bryan Battery, Varney's Amalgamators and Separators, Ryerson's Superheated Steam Amalgamators and Rotary Crushers, Stone Breakers, &c. Orders respectfully Solicited.

GODDARD & COMPANY,

REMINGTONS'
ARMY AND NAVY REVOLVER,
THE REMINGTON REVOLVER

Has been approved by the United States Board of Ordnance, and has so satisfactorily met the requirements of the Government, not only in the field, but in the official tests and examinations made by prominent officers of the Ordnance Department, that it stands at once the most popular, serviceable and approved arm of the kind in use. Upwards of 125,000 have been supplied to the Government within the past four years, for the land and naval service, furnishing ample evidence of the estimation in which the arms are held.

Simple and symmetrical in its entire construction, securely strong, of most modern improvement in mechanism and material, its unequaled range and penetration, together with its durability, are points in its favor now well known, and which challenge a comparison with any other pistol of the kind made in this country or in Europe.

The superior strength and capacity of the arm for constant and long use is apparent from the fact that the entire frame is constructed of a single piece of metal, thus preventing the extension of some portions of the frame, from the effect of firing—a serious defect in many pistols—in which the frame is composed of two or more parts.

The frame of the Remington Revolver furnishing a TOP STRAP or support above the cylinder, served to protect the base pin (on which the cylinder revolves) from any undue strain to which it would otherwise be subjected, and which would immediately render the fire of the arm from the cylinder to the barrel imperfect, thus destroying force and accuracy.

Another advantageous feature of the arm is the means afforded for the instantaneous removal of the cylinder from the frame. This not only facilitates the cleaning of the pistol, but by the quick adjustment of the cylinder, one pistol can be made as effectual as two—and considering the difference of weight, it is far preferable—by simply possessing a spare cylinder loaded and capped to instantly replace the exhausted one.

The above is a general summary of the points of peculiar merit in the Remington Revolver which a trial of the arm is only needed to attest. For sale at Manufacturers' rates, by

ANNUAL REPORT
—OF THE—
Pacific Insurance Company.

IN COMPLIANCE WITH THE ACT OF THE LEGISLATure of the State of California, entitled "An Act concerning Corporations," passed April 22, 1850, the Pacific Insurance Company of San Francisco makes the following Annual Report:

I.—The amount of the Capital Stock of this Company is SEVEN HUNDRED AND FIFTY THOUSAND DOLLARS, all paid in GOLD.....$750,000

II.—The amount of the Assets is ONE MILLION AND FIFTY-ONE THOUSAND, FOUR HUNDRED AND TWENTY DOLLARS AND THIRTY-SEVEN CENTS..$1,051,420.37

III.—The Company has NO DEBTS

IV.—The amount of insurance effected during the year, and which remained in force December 31, 1865:

Fire	$12,973,949
Marine	481,403

This Company commenced underwriting Marine Risks, August 1, 1865:

V.—This Company insures against the following risks, viz.: BUILDINGS, HOUSEHOLD FURNITURE, MERCHANDISE, RENTS, LEASEHOLDS, VESSELS IN PORT AND THEIR CARGOES, and other PERSONAL PROPERTY, AGAINST LOSS OR DAMAGE BY FIRE.

Also, on CARGOES, TREASURE, COMMISSIONS, PROFITS, and WAR RISKS, and ON ALL MARINE AND INLAND NAVIGATION RISKS, TO AND FROM ALL PORTS IN THE WORLD.

VI.—This Company will take on any FIRST-CLASS RISK not to exceed $75,000 (the limit fixed by law), and on all large risks will reinsure to the extent consistent with PRUDENCE in other RESPONSIBLE COMPANIES.

The Great Pain Annihilator.

DR. E. R. JOHNSON WILL WARRANT TO CURE ALL cases of Asthma, Fever and Ague, Catarrh, Sore Throat, and Womb Diseases. The Doctor's success is miraculous in cases of RHEUMATISM, NEURALGIA, CONSUMPTION, GOUT, PARALYSIS, INFLAMMATION OF THE EYES, and all other diseases that human skill can reach. Rheumatic Pains removed in five minutes. Some of the afflicted that visit him come from one to six hundred miles, and soon find relief. Persons at a distance can be cured at home by addressing a letter to Dr. Johnson, No. 700 Market Street, San Francisco, stating case, symptoms, length of time the disease has continued, and have medicine promptly forwarded to any part of the country, with full and plain directions. ☞ Consultation by letter or otherwise, FREE. 16v12-1m

It is filled with reliable, useful and interesting matter, and to our miners who wish to understand the theoretical, as well as the practical part of their business, the MINING PRESS will be found an invaluable aid.—[Nye County News

VOLUME TWELFTH.—The MINING AND SCIENTIFIC PRESS, with its last issue, commenced its twelfth volume. Since Dewey & Co. have "held the ribbon" its gait has been quite toward a perfect journal. Its appearance evidences its prosperity, but doubtless, like some of the rest of us, it can stand increased encouragement. Let such be given, and, our word for it, volume thirteen will acknowledge receipt.—[Golden Era.

FLOWERS, when wrought into skillful devices, to represent the excellence of the dead and the hopes of immortality beyond the grave, are the most irresistible and eloquent and pure of all expressions of human love, when strewn upon the unostentatious bier.

PHOTOGRAPHIC albums with musical boxes concealed in the covers, are at present a novelty in England.

THOSE who weep over errors are not formed for crimes.

J. B. CONE, BUSINESS AGENCY.—Makes private sales of Property and Business Places of every description, in the city and throughout the State; procures partners with large and small amounts of money; negotiates sales of mining property, and does a General Agency Business. Patronage solicited by mail, express, or by personal application at the office, 402 Montgomery Street, San Francisco, California. 23v11tf

Economy in Advertising.—The MINING AND SCIENTIFIC PRESS is the best and most ECONOMICAL mining advertising medium in this city. Our terms are less than ONE HALF the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The PRESS contains, proportionally, a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the eighth day of May, 1866, an assessment (No. 12) of one dollar per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, S. DICKINSON, at the office of the Company, No. 423 Washington street, Room No. 15, up stairs, San Francisco, between the hours of 11 A. M. and 1 P. M.

Any stock upon which said assessment shall remain unpaid on the nineteenth day of June, 1866, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the sixteenth day of July, 1866, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

S. DICKINSON Secretary.

Office, 423 Washington street, San Francisco, Cal.

San Francisco, May 9, 1866. my12-6w

Nuestra Senora de Guadelupe Silver Mining Company, Tayoltita District, Durango, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 25th day of April, 1866, an assessment (No. 23) of one dollar per share was levied upon the capital stock of said Company, payable immediately, to the Secretary, E. J. PFEIFFER, at the office, No. 210 Post street, (in the Drug store, near Oupont,) or to the Treasurer, A. HIMMELMANN, at his office, No. 637 Washington street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the 1st day of June, 1866, shall be deemed delinquent, and will be duly advertised for sale at public auction, on Saturday, the 2d day of June, 1866, and unless payment shall be made before, will be sold on the 25th day of June, 1866, to pay the delinquent assessment together with costs of advertising and expenses of sale.

E. J. PFEIFFER, Secretary.

Office, 210 Post street, (Drug store, near Oupont street,) San Francisco, Cal. ap28

North Star Gold and Silver Mining Company, Reese River Mining District, Lander County, Nevada.

NOTICE.—There are delinquent, upon the following described stock, on account of assessment levied on the 9th day of April, 1866, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
John W Harker	350	6	$150 00
John W Harker	455	6½	162 50
G F Sharp	447	2	50 00
Mary F Breizo	243	4½	112 50
R B Goddard	251	9¾	231 25
J P Sharpstein	441	15	375 00

And in accordance with law, and en order of the Board of Trustees, made on the 9th day of April, 1866, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of the Company, on Wednesday, the 6th day of June, 1866, at the hour of 2 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

GOTTLIEB BEER, Secretary.

Office, 226 Front street, San Francisco. my12

Book Printing should be considered and treated as one of the higher branches of the "Art of Arts," and its execution entrusted only to experienced and intelligent workmen. Strict attention will be given to all orders for BOOK AND PAMPHLET PRINTING entrusted to the Mining and Scientific Press Job Office.

Rippon Gold and Silver Mining Company, Silver Mountain District, Alpine County, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 8th day of May, 1866, an assessment of one dollar per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, 333 Montgomery street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the 11th day of June, 1866, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 2d day of July, 1866, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

JAMES C. DAVLEY, Secretary.

Office, 333 Montgomery street, San Francisco, Cal. my12

Salamander Gold and Silver Mining Company, Salamander Creek, Calaveras County, Cal.

NOTICE.—The regular annual meeting of stockholders of the said Company, to elect the officers for the ensuing year, will be held on MONDAY, the 21st day of May, 1866, at 8 o'clock, P. M., at the office of the Company, No. 210 Post street (in the Drug store, near Dupont street). By order of the Board of Trustees.

E. J. PFEIFFER, Secretary.

San Francisco, May 2d, 1866. my5 2t

Simpson & Bosselle Mining Company.—Mines located in Carson Valley.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 20th day of April, 1866, an assessment of one dollar per share was levied upon the capital stock of said Company, payable on the 30th day of April, 1866, in United States gold and silver coin, to the Secretary, or to Dr. J. W. WATERS, Markleeville, Cal.

Any stock upon which said assessment shall remain unpaid on the 25th day of May, 1866, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Thursday, the 14th day of June, 1866, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

T. L. BIBBINS, Secretary.

Office, 305 Montgomery street, San Francisco, Cal. ap28

Silver Queen Mining Company, Reese River District, Lander County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 24th day of April, 1866, an assessment of one (1) dollar per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, at the office of the Company, No. 608 Merchant street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the 23d day of June, 1866, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 23d day of July, 1866, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

I. T. MILLIKEN, Secretary.

Office, 608 Merchant street, San Francisco, Cal ap28

Sierra Valley Gold and Silver Mining Company, Plumas County, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 26th day of April, 1866, an assessment of one (1) dollar per share was levied upon the capital stock of said Company, payable immediately, in gold coin of the United States of America, to the Secretary, at the office of the company, No. 607 Washington street, in the city and county of San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the 31st day of May, 1866, will be duly advertised.

Any stock upon which said assessment shall remain unpaid on the 31st day of May, 1866, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 18th day of June, 1866, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

A. NOEL, Secretary.

Office, 607 Washington street, San Francisco, Cal. ap28

United States Mining Company.—Location of Virginia District, Storey County, Nevada

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 19th day of April, 1866, an assessment of one dollar per share was levied on each and every share of the capital stock of said company, payable immediately, in gold coin of the United States, to the Secretary, at his office, or to Oa. T. H. PINKERTON, South B street, Virginia, Nevada.

Any stock upon which said assessment shall remain unpaid on Saturday, the 26th day of May, 1866, will be advertised as delinquent, and unless paid, will be sold on Wednesday, the 13th day of June, 1866, to pay said delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. M. BUFFINGTON, Secretary.

Office, No. 10 Government House, corner Sansome and Washington streets, San Francisco. ad21

Whitman Gold and Silver Mining Company. Location of Works: Indian Springs District, Lyon County, Nevada.

Notice is hereby given that the Annual Meeting of the Shareholders of the Whitman Gold and Silver Mining Company, for the election of Trustees and the transaction of such other business as may be presented, will be held at the office of the President of the Company, CHARLES MAYNE, Esq., No. 535 Clay street, San Francisco, on TUESDAY, the 5th day of June, 1866, at the hour of 8 P. M.

Per order

THOS. W. COLBURN,

Secretary Whitman G. & S. M. Co.

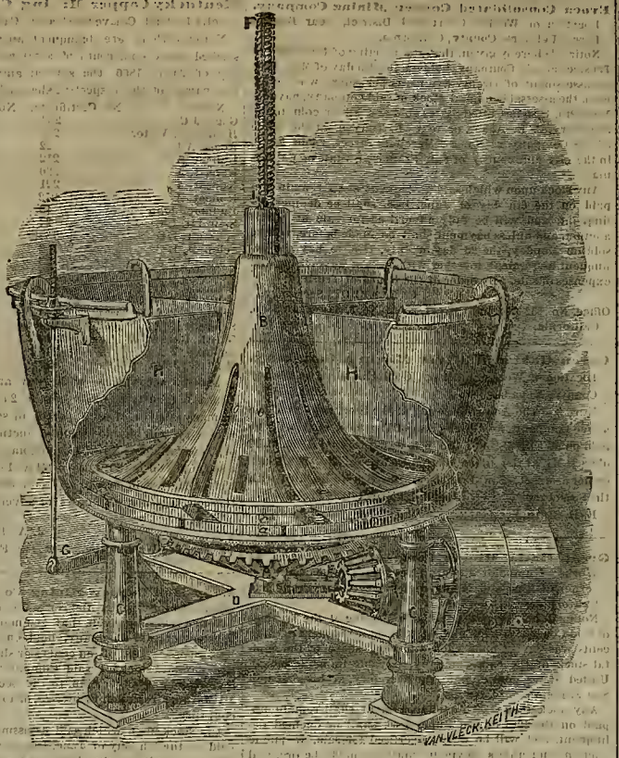
San Francisco, Cal., May 12th, 1866. my12-4t

Delays are Dangerous.—Inventors on the Pacific Coast should bear in mind that by patronizing our Patent Agency they can sign all necessary papers for securing patents almost immediately, thereby avoiding the three month's delay requisite in transacting business through Eastern agencies.

MONEY BY MAIL.—Subscribers and advertisers remitting us money in less sums than $50, can do so by mail at our risk, if they will register their letters; we will take no risk on unregistered letters, or letters by express. Remittances by express must be prepaid

THE EXCELSIOR GRINDER AND AMALGAMATOR.

In the engraving herewith preeented, A represents the Rim of the Pan; B, Muller; C, Lege; D, Cross-Frame; E, Gearing; F, Screw; G, Lever; H, Dash-Boards; I, Key; *a*, Dies; *c*, Shoes, and o, Openings.



The relative grinding capacities of "The Excelsior" Grinder and Amalgamator, of the Flat Bottomed Pan, and of the Conical Pan *when properly constructed*, are respectively 177, 98 and 110.

That is, the respective mullers being of the same diameter, same weight, same hardness, and running at the same velocity "The Excelsior Grinder and Amalgamator" will reduce one hundred and seventy-seven tons of ore, the Flat Bottomed Pan ninety-eight tons, and the Conical Pan one hundred and ten tons to the same degree of fineness in the same time.

The wear to the Shoes and Dies at their grinding surfaces in the Excelsior Grinder and Amalgamator, is perfectly uniform, thus securing evenness of reduction to the pulp, as well as steadiness of motion to the muller. Uniform wear of the grinding plates has been attained in no other than that of the Tractory form—nor can it be.

"Another property of excellence in this machine is that the metal or substance to be amalgamated passes *direct* from the grinding surfaces into the quicksilver; thus excluding the possibility of its becoming coated with any foreign substances, after having been burnished. It is truthfully said "that the Tractory-formed Pan as a Grinder has no equal, and as an Amalgamator no superior."

As a whole, it is far superior to any other pan in use.

MANUFACTURED AT THE

Union Iron Works and Golden State Iron Works,

WHEELER & RANDALL, Inventors.

The undersigned having had several years of experience in practical quartz mining operations, will ever take great pleasure in furnishing parties interested in mining and machinery any desired information which they may possess.

Machinery.

SAVE YOUR MONEY AND BUY,

For $100!

HUNTER'S

Premium Cnocentrator!!

Awarded a Silver Medal at the Mechanics' Fair of 1865.

THE ABOVE MACHINE HAS BEEN RECENTLY IMproved and simplified, doing away with all complication and friction, thereby requiring less power and speed. As improved, 125 revolutions per minute is the regular speed required, but any speed varying from 100 to 135 revolutions does not change the results. It is the only machine built on the Pacific coast that is perfectly adjustable for all the different grades of ores, and will save ten per cent. more sulphurets than any Concentrator in use, and is the cheapest, from the following list of prices:

For a single machine of the capacity of five tons in twenty-four hours, as it passes from the battery or pans, $125. For double machines of two, three, or four tables in one frame, each table of five tons capacity, $100.

I have been running machines for the past three months at Grass Valley, therefore I make my assertions from a practical working test, where several of the machines are working. Persons desirous of seeing the machines running, can do so at Empire Mill, Grass Valley, where twelve machines can be seen in operation, or in San Francisco, at 148 Washington street, below Davis, where ALBERT JACOBS will all their orders promptly.

Pacific Forge Company.

FORGING AND IRON WORK.

THE PACIFIC FORGE COMPANY HAVE JUST ERECTed, in this city, on Fourteenth street, near the machine shop of the San Jose Railroad, a large establishment for the purpose of forging and working in wrought iron. Our hammer is the largest upon this coast, and we are prepared to manufacture, at short notice, all kinds of heavy forgings; car axles, shafts, steamboat cranks, piston-rods, wagon axles, and other similar work. This is the first general shop of the kind erected in this State, and we solicit the patronage of the public. All orders executed at reasonable rates, and with promptness and satisfaction. 19v12-3m

"Safety Cages."

(PATENT GRANTED.)

MINING COMPANIES

WILL FIND IT TO THEIR INTEREST TO ADOPT "Berry, Hochholzer & Denver's Safety Cage" in their hoisting works. It requires very little more work to manufacture than the ordinary style of cages—any blacksmith can make it. It has been PROVED TO BE PERFECTLY SAFE, is self-acting and very light, and will, in the item of rope alone, pay for itself in a short time.

The proprietors refer to the following mining companies, among others, that are now using this Safety Cage:—Gould & Curry, Savage, Ophir, Mexican, Empire, Overman and Justis.

For particulers and terms, apply to

HUGO HOCHHOLZER,
Virginia City, Nevada,
15v11tf Through Wells, Fargo & Co's Express.

BRUCKNER'S Mechanical Roasting Furnace

AWARDED A

PREMIUM SILVER MEDAL

—BY THE—

The Mechanics' Institute.

THESE FURNACES ARE NOW MANUFACTURED after an improved mode of construction, which

GREATLY SIMPLIFIES THEIR OPERATION,

and affords a much larger oxydizing surface to the action of heat and atmosphere.

The weight of a Furnace nine feet long by four feet in diameter does not exceed one ton.

THE IMPROVED FURNACE

will soon be more fully described and illustrated in the columns of the MINING AND SCIENTIFIC PRESS.

Parties wishing to erect such Furnaces, are requested to leave their orders with

IRON PIPE.

M. R. ROSE, CORNER OF 9TH AND K STREETS, Sacramento City, has facilities unsurpassed on this coast for the manufacture of IRON PIPE of every description. He also has on hand a deep well FORCE PUMP, of his own invention and manufacture, well adapted for oil wells. His tools being portable, pipe can be manufactured on the ground. 19v12-

[Written for the Mining and Scientific Press.]

Mining as it is in Reese River.

EDITORS MINING AND SCIENTIFIC PRESS:—Mining, when properly defined, is a compound of sciences. To be a thorough miner one must practically understand every branch—the proper way to open a mine and secure it against damage through weight or pressure of earth; economical and expeditious working; the quality and quantities of ores; the value of material; the application of material; the worth of machinery and steam-power; the application of steam, and the observance of all changes in formation, as often found in the working of a mine. This much, at least, should be known practically by all those having in their charge a mine; but how seldom it is that such positions are filled by men having such knowledge.

Thus it is, that those having a hope of realizing profits from our mines must be patient, as at present there is little being done to warrant further investment. Through the mismanagement of mining agents the present and future of our mineral region is anything but flattering to those desirous of interesting themselves permanently, or to the transient speculator. A few days' inspection satisfies them thoroughly that the present plan of working is erroneous; that to invest is to disburse money with but slight prospect of a reasonable return. Neither do they see the busy business life there should be in a country so rich in minerals as every one believes this to be. Every facility for making investments profitable is here; but still intelligent capitalists are wary, knowing that by proper management alone the desired end can be attained. They cannot refrain from asking why it is that so many large and truly magnificent mills are lying idle, when, by the development of the mines, they would be running. They are satisfied that had one-third of the money that has been expended in mill building been judiciously applied in the development of mines, under the direction of men practically conversant with mining, every business would be better. They see, too, that the dearly-bought experience of capitalists has not cured them of folly; as mills are still being built and contracted for on mines as yet not prospected twenty feet below the surface. If it were otherwise, those ready and willing to invest would have some foundation on which to base their investments.

Many invest in our mines, never having been in the country, and are so induced to do by flattering reports gotten up for the occasion. Through these reports moneyed men become to all appearance interested, and through them a company is formed—large quantities of stock are thrown on the market, and is picked up at different rates by mechanics, draymen, servants, and others totally unacquainted with the "art of mining brokering." These reports are written up by the hundred, and to suit the circumstances of the buyer, varying one from the other only in respect to penmanship and signatures. Scores of them are written without the reporter having seen the mine in question—(in truth it would make little if any difference with most of them if they did examine the mine, as I candidly believe there are not half a dozen of the whole army of them that ever excavated a wheel-barrow load of ore).

Mines are sold because of these representations, and on the authority and over the signature of men who, from the position they occupy, or assume to occupy, hold themselves before the world as being experienced in mining—as being capable of judging of the position and merits of a mine, and, in nine cases out of ten, the report believed, through the simple signature—no effort being made on the part of the purchasers to get a true statement of the facts under which the mine exists and has been worked, or of refuting, if possible, the statement gotten together for the mere purpose of consummating a sale.

We are cautioned not to speak in disparagement of our mines, because of its tendency to withhold capital from our mines. We do not. There is no particular secret that I am aware of in the manner in which the "fixing up" of claims is done. First, we want much money put in the country (in mills, if they prefer it); secondly, we want and expect them to spend as much more in the country to secure the first investment, giving them a large field for their operations.

The statement that our mines are not de-

veloped is proven from the fact that no mill in the Reese River section is crushing ore from the mine on which it was founded. Those disbelieving this assertion need only look for themselves, or make inquiry of any man, woman, or child in the section. All energies and means placed at the disposal of the superintendents have been consumed in the erection of mills—the developement of mines being left to posterity.

I ask the owners and possessors of our mineral lands whether such proceedings tend to encourage investment—whether it lends anything to the development and prosperous future of our country, and whether we are by it benefited in any way permanently. PROGRESS.

Austin, April 28th, 1866.

Perilous Situation.

Once only Mr. Wise, the aeronaut, found himself in a difficulty which alarmed him. On ascending in May, 1839, just as he was about to start, a gentleman from the South' was introduced to him, and so held him in conversation, that when he severed the restraining cord it occurred to him that the valve-rope had not been secured! The mistake could not be remedied. For a moment he began to despond and would have given all that he possessed in the world to be down on earth again for one minute. Soon finding that a heavy heart was not the thing for ascending in a balloon, he rallied his spirits; 'took off his hat and ewung it around; which was vociferously responded to from below.' The crowd, however, little knew about the valve-rope, whatever the Southern gentleman may have done. Mr. Wise let down a parachute containing an animal; saw it picked up, and with more sentiment than could have been expected, envied that cat or dog and wished he was by its side on *terra firma*. For the fact that he was driving rapidly toward the Atlantic Ocean, without even the security of being able to burst his balloon; going at the rate of fifty miles an hour; and his machine in such unfortunately good repair as not to afford the hope that it would explode, collapse, or meet with any favorable accident. Under these disheartening circumstances, he found that he had already used up one half of Jersey, and that Princeton was not far ahead. Just at this time he entered into a thunderstorm; the water poured down from the balloon with a noise like a mill-dam! The lightning shot in zigzag flashes through the rolling clouds; and the thunder rattled like the discharge of small arms.

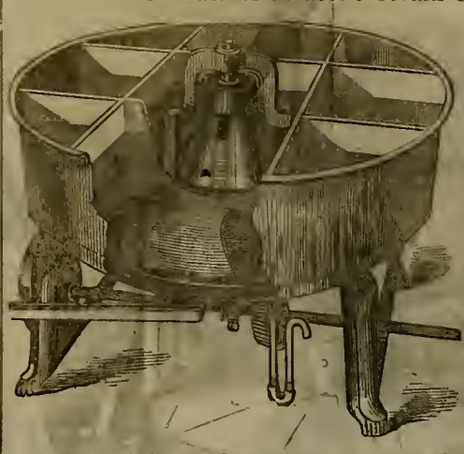
It was a magnificent sight; 'but in recurring to his critical situation, its charms passed from his mind.' When it became apparent that another hour would carry him to the Atlantic, he admits that the moment was embarassing; but considering that 'what must be must,' his thoughts turned in a very practical way toward his provisions for a voyage to Europe, and those consisted of 'half a pound of water-crackers, half a pound of cheese, and a bottle of porter.' He estimated, however, that this stock would be sufficient to take him across at the rate at which he was traveling—fifty miles an hour; but he could not hope that his gas would hold out three days, because the neck of the balloon was left open. Considering every alternative for securing personal safety, he thought of jumping overboard whilst first leaving land and plunging into the ocean; but on reflection he gave up this idea. Then he saw the great Atlantic swelling proudly to the arched roof of heaven. There was no time to be lost. He had endeavored to split his flag-staff, and to fasten a penknife so as to cut the silk; he tried to burst the balloon by jerking the car violently; but this plan failing, he determined to try the effect of an extreme ascent; threw his ballast overboard, and shot into the air till the distended sphere discharged the gas copiously at the neck. He continued to jerk the ear, and at last, oh, joy! the valve-rope rolled out of the neck sufficiently for him to reach it. Mr. Wise's descent into a Jersey farmer's peach-orchard is graphic and lively. We conclude, as he writes the account himself, that he was not killed—but he does not state the fact.

THE WONDERS OF CHEMISTRY.—Aquafortis and the air we breathe are made of the same materials. Linen and sugar and spirits of wine are so much alike in their chemical composition that an old shirt can be converted into its weight in sugar, and the sugar into spirits of wine. Wine is made of two substances, one of which is the cause of almost all combination of burning, and the other will burn with more rapidity than anything in nature. The famous Peravian bark, so much used to strengthen the stomach and the poisonous principle of opium, are found to be of the same materials.

GAS FROM PEAT.—The Lansinburg gas works, near Troy, N. Y., are now using peat instead of coal for the manufacture of their gas. The illuminating qualities of this peat gas is said to be superior to that derived from the best of coal.

Knox's Improved Patent Amalgamator and Separator,

With Palmer's Patent Steam Chamber or Die.



THIS CUT REPRESENTS AN AMALgamator and Separator that has stood the test of EIGHT YEARS' practical working in the gold mines of California, and for nearly the same time in the silver mines of Nevada, having been introduced into the first steam mills built in the then Territory, since which time they have been successfully working against all competition.

The great advantages these Amalgamators have over any others, are—

1st. Much less Cost.

2d. They do not "flour" the mercury, and collect any that may have been "sick-ened" in the battery or grinders.

3d. The "sloshing" motion given to the pulp (by the revolution of the muller under the stationary frame) against the amalgamated copper plates that are fastened to the frame, and by this means catching the fine gold and mercury that will not settle.

4th. The gate in the cone, through which the pulp is discharged, from the top, and where there is the least motion, almost precluding the possibility of any granulated mercury or fine gold escaping.

There are over 500 of them in use in California and Nevada, where those interested can see their practical workings.

☞ For further particulars, inquire of ISRAEL W. KNOX, or W. A. PALMER, Inventors,

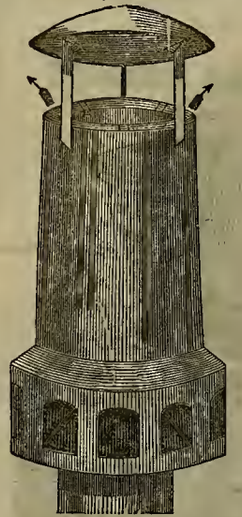
A RARE CHANCE FOR INVESTMENT.

THE PATENT RIGHT FOR SALE



FOR STATES, TOWNS AND COUNTIES.

For the Best Chimney Top

Ever invented. Numerous testimonials from Proprietors of Factories, Foundries, Steamers, Hotels, etc., can be shown, attesting to its usefulness in creating draft, saving the expense of high chimneys, and a great saving of fuel.

Pamphlets containing descriptive drawings and testimonials will be sent free, upon application by letter or otherwise to the patentee,

E. A. HENRIKSEN,

Or J. E. JOERGENSEN,

12v12-3m No. 328 Kearny street, San Francisco.

Union Amalgamator.

This Valuable Invention

IS FAST FINDING ITS WAY INTO GENERAL USE, NOT by means of combination of capital and influence, but on the strength of its own merits, and upon the principle that what is known to be good will be appreciated. Practical men acknowledge the UNION PAN to be scientific, the best, the cheapest, and most profitable. It now stands first on the list of all pans in use for the purpose of

Working Gold and Silver Ores.

It has been found, that a low class of ores, also tailings from Mills, Sulphurets, etc., that will not pay to work with the common pans, may be worked with this and obtain large profits. The UNION PAN is manufactured in two sizes; and capable of operating upon large quantities of ore in the most efficient manner.

Parties interested in Quartz Mining, Mills, etc., will find it to their advantage to call and examine for themselves, and see its operation.

Gold and silver ores tested by regular mill process, at moderate cost, by

STRONG & CO.,

San Francisco Foundry, corner Mission and Fremont streets, where orders will receive prompt attention.

16v12-3m

BAUX & GUIOD'S

Separator & Amalgamator

Is the most important improvement in mining machinery ever introduced. It was awarded the FIRST PREMIUM at the San Francisco Mechanics' Fair for 1864, where it proved itself to be the best Separator and Amalgamator among all the competitors. Constructed on principles which combine SCIENTIFIC KNOWLEDGE WITH PRACTICAL EXPERIENCE, these Pans extract more gold and silver from their ores than any others in use, as a few hours trial will demonstrate. Mill men will find it to their advantage to employ these pans as Separators, in addition to the ordinary Amalgators now in use, and to re-work their old tailings.

The cost of these pans is inconsiderable, and their structure is such that they can be readily separated in parts convenient for packing on mules. Among the many advantages possessed by BAUX & GUIOD'S Pan, are the following: The trifling cost for attendance; its small cost; its portability; The large quantity of pulp it can operate upon in a given time; It may be worked even weeks without stopping as it is constructed to work continuously; The complete thoroughness of the separation of the rock from the metals and the trifling power required to work them; They can be attached to any ordinary crushing apparatus.

We have the pleasure of referring parties interested to the following parties, who have our Pan in use: Jeffersonian Mining Company, Bowman's Ranch, Nevada county; The French Mill, Nevada City; Crall's Gravel Cement Works, Nevada county; Waltman's Chlorination Works, Nevada, Cal.; Gold Hill Quartz Mill, Washoe.

Manufactured at the Vulcan Iron Works and San Francisco Foundry, San Francisco, and at Heugh & Thom's Foundry, Nevada City.

For further particulars, or to see this Pan in operation, call on or address

J. B. BAUX,

Fremont Street, near Mission, adjoining the San Francisco Iron Works, San Francisco. 4v8-6df

Devoe & Dinsmore's Machine and Iron Works,

SAN FRANCISCO.

☞ Machines constantly kept on hand, to supply orders at the shortest notice.

Address: MOROAN HUNOERFORD,

10-v12 San Francisco, Cal.

IRON!

Glasgow Iron and Metal

IMPORTING COMPANY,

Nos. 25 and 27 Fremont street, San Francisco,

Keep constantly on hand a large assortment of

Bar Iron,

Boiler Tubes,

Anvils,

Cast Steel, Etc.,

Which they offer to the trade on liberal terms. 18v12-3m

NEW MINING PUMP.

Excelsior Double-Acting Suction and Force Pump.

W. D. Hooker's Patent, August 15, 1865.

THE SUBSCRIBERS OFFER FOR SALE the following sizes of the above-named celebrated Pump, acknowledged to be the best Double Acting Pump known to be in use. They are more easily set in position, and are more durable and compact than any other Double Acting Force Pump; they are also worked with very little friction, and have greater forcing power than other pumps of like size. They are adapted to work by hand, wind-mill, horse, or steam power.

No. 1—Cylinder 2½ in., stroke 6 in.
No 2—Cylinder 3 in., stroke 7 in.
No 3—Cylinder 4 in., stroke 10 in.
No. 4—Cylinder 5 in., stroke 15 in.
No 5—Cylinder 6 in., stroke 18 in.
The Nos. 4 and 5 are Mining Pumps.

We have also for sale a full assortment of Pump Fixtures, such as Iron Pipe, Hose, Brass Goods, etc.

J. W. BRITTAN & CO.,

12v12-3m 120 Front street.

VARNEY'S PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been or will be, spared in have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setters made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setters for themselves, at the PACIFIC FOUNDRY,

1v1 San Francisco.

BLAKE'S QUARTZ BREAKER

Is now extensively used for breaking hard masses of

Quartz or Ores

To a size suitable for stamps. These machines are patented, and are in practical operation in

CALIFORNIA, AUSTRALIA, WASHOE, ENGLAND, FRANCE, AND THE ATLANTIC STATES.

These Machines, or circulars containing further information regarding them, may be obtained of the undersigned. Address,

BLAKE & TYLER,

Box 2077 San Francisco Post Office.

CHAS. T. BLAKE, Idaho City. E. TYLER, Michigan Bluff. WM. P. BLAKE, San Francisco.

Office, "Beaty House," (directly opposite the Court House,) San Leandro. 19v12-3m

WASTE IN GOLD MINING.—There appears to be as much waste in washing quartz in Australia as in California. A correspondent of the London *Mining Journal* states that while on a recent visit to Clunes, Australia, he took samples of the refuse sulphurets of gold washings, belonging to three companies, and obtained from them gold at the rate of 28 oz 5 dwt.; 29 oz. 9 dwt.; and 30 oz per ton.

THE SCHOOL OF MINES, connected with Columbia College, New York city, is said to already number over eighty students.

THE proud have no friends—not in prosperity, for then they know nobody; nor in adversity, for then nobody knows them.

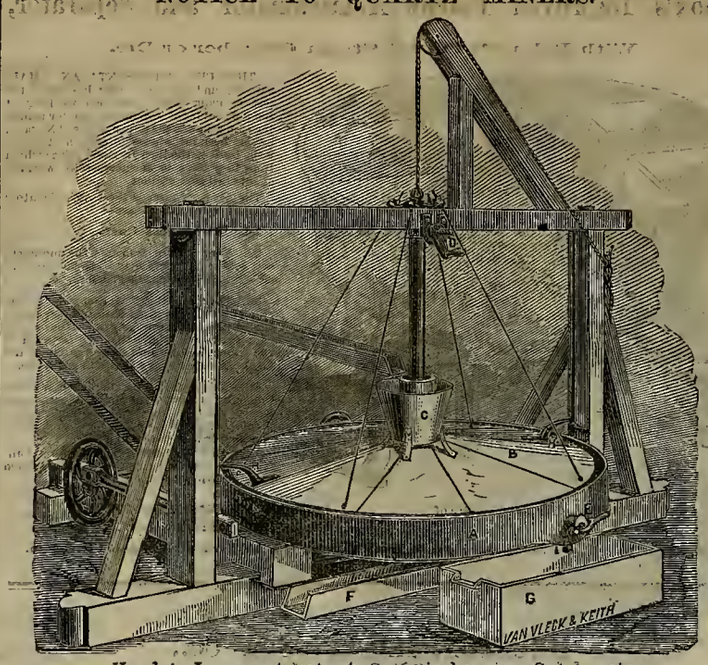
NOTICE TO QUARTZ MINERS.



Hendy's Improved Patent Self-Discharging Sulphurets
PRATER CONCENTRATOR
Is Receiving Universal Favor.

Reference is made to the following Mills which are using the Prater Concentrator, with some of the improvements attached. The Self-Discharging Sulphurets has been more recently adapted, and the public attention is called to examine its workings:

STEPHENS' MILL, Humboldt County, Nevada.
CHRYSOPOLIS MILL, " "
U. S. REESE RIVER MILL, Austin, "
UNION MILL, El Dorado County, near Mud Springs.
NEW YORK AND EL DORADO CO., " "
CONEY MILL, Jackson, Amador County.
Messrs. TIEBS & CO'S MILL, San Andreas, Amador Co.
WINTER'S MILL, Angels Camp, Calaveras County.
CLIO MILL, Jacksonville, Tuolumne County.
CARROL & ASPINWALL MILL, Reese River, Nevada.

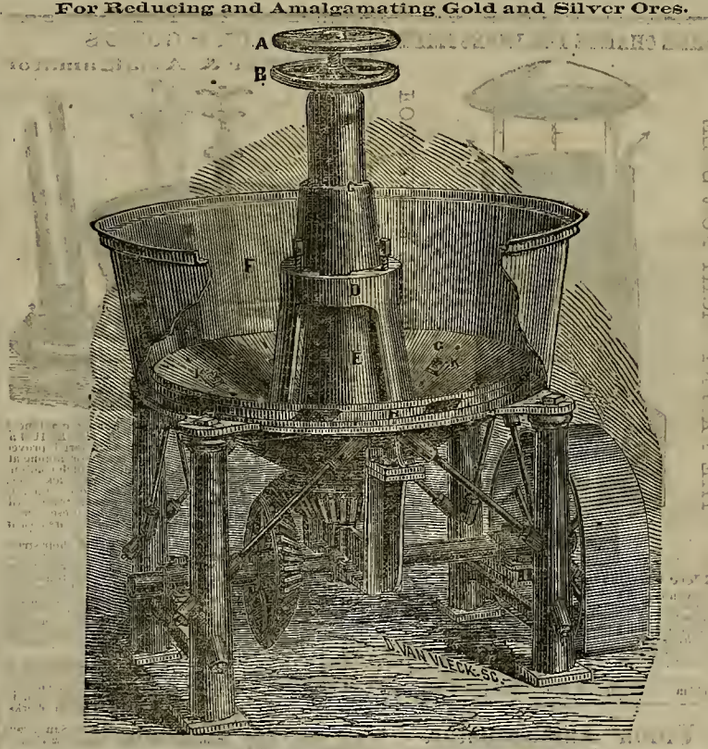
And in use in other parts of this State; also in Idaho, Arizona, Colorado and Mexico.

As further evidence of its worth, orders have been received recently from the proprietors of the following mills, all of whom are using these Concentrators, or have works in the immediate neighborhood of mills using them, viz:

One Concentrator ordered for the Coney Mill, Jackson, Amador County, by Messrs. Bigelow & Bro., of this city.
Three Concentrators for the Spring Hill Mill, Volcano, Amador County.
Two Concentrators for the Golden Gate Mill, Volcano, Amador County.
Four Concentrators for the Raw Hide Ranch Mill, Sonora, Tuolumne County.
Six Concentrators for the Benton Mill, Bear Valley, Mariposa Co; ordered by Messrs Hodge & Bro, San Francisco.

They may be seen in operation at the GOLDEN STATE FOUNDRY, No. 19 First Street, San Francisco.
☞For explanation of the above engraving, and other particulars, send for a Circular
JOSHUA HENDY,
8v12tf No. 402 Montgomery street, Room 3, 4th floor.

HEPBURN & PETERSON'S PANS AND SEPARATORS.
For Reducing and Amalgamating Gold and Silver Ores.



WE invite the Mining Public to examine the record of our Machines before adopting any other for producing similar results. They have been in general use for the past three years, during which time they have been repeatedly tried in comparison with every other machine of note, and of a similar nature, and have invariably been adopted in preference; which facts we offer as the most suitable recommendation, and which is attested by the following list of

Principal Mills Using them:

Commencement of Fourteenth Volume

—OF THE—

Mining and Scientific Press

Published Every Saturday.

The title of our journal is a truthful expression of its character.

It affords a class of progressivo information to the Miners, Mechanics and Professional Men of the Pacific Coast, which cannot be derived from books, or other publications.

Each Volume comprises, in reality, a book of new intelligonce and facts relating to Mining, Mechanism, Metallurgy, Science and Art, developed by our rich and peculiar resources, and identical with our own industry and history.

By the encouragement of intelligent economy in LABOR and GOLD-SAVING, we shall make the PRESS a source of INDIVIDUAL PROFIT to its patrons, as well as a public benefit to every local community in which it circulates.

The prospects of our journal are now brighter than at any former period. Our facilities for furnishing a valuable paper are constantly increasing.

Editorial Expressions:

Following are some of the many opinions gencronsly expressed by our neighbors:

MINING AND SCIENTIFIC PRESS.—The paper whose name we have just written, ranks among the leading scientific journals of the world. On mining matters it certainly has no equal, and more than all other causes combined, it has advanced the interests of the quartz miners of the Pacific Coast. Its editors are men of thorough education and large practical experience, and its list of contributors embraces many names distinguished in the various fields of scientific exploration and mechanical invention. The MINING AND SCIENTIFIC PRESS ought to circulate universally among intelligent Californians, to whom we most cordially commend it, and its traveling agent, O. P. Truesdell, who is now canvassing this city and county, and will shortly visit other counties in the southern part of the State, in its interest.—[Stockton Daily Independent, Sept., 1866.

"SULPHURETS," and "Our Lady Correspondent," of the MINING PRESS, have each contributed an interesting article on Mines and Mining in Amador county. Hope they will keep up the fire. One of our subscribers complains that "Sulphuret" fell into an error, in stating that the sulphurets of the middle or Jackson range are richer than those on the upper or Pine Grove. He thinks it is just the reverse.—[Amador Ledger.

VOLUME TWELFTH.—The MINING AND SCIENTIFIC PRESS with its last issue, commenced its twelfth volume. Since Dewey & Co. have "held the ribbons" its gait has been rapid toward a perfect journal. Its appearance evidences its prosperity, but doubtless, like some of the rest of us, it can stand increased encouragement. Let such be given, and, our word for it, volume thirteen will acknowledge receipt.—[Golden Era.

We receive, regularly as clock work, this exceedingly valuable and interesting journal.—[Napa Reporter.

A VALUABLE AND USEFUL JOURNAL—ESTABLISHED IN 1860.

AMERICAN AND FOREIGN PATENTS SOLICITED.

MODERATE AND UNIFORM PRICES TO ALL.

—AND—

BOOK AND JOB PRINTERS,

505 CLAY ST., SAN FRANCISCO. COR. SANSOME.

PRINTING OF EVERY VARIETY CORRECTLY AND PROMPTLY DONE.

MINING AND SCIENTIFIC PRESS.—We received a visit a few days since, from Mr. Wood, agent for the MINING AND SCIENTIFIC PRESS, who is now canvassing this county for subscribers to that valuable journal. The PRESS is invaluable to miners and mechanics, being the only journal of any importance on the coast entirely devoted to their interests.—[Mountain Messenger.

SUBSCRIBE FOR IT.—The large, illustrated sixty-four column weekly newspaper—the San Francisco MINING AND SCIENTIFIC PRESS—should be taken by every miner, prospector, and intelligent citizen throughout Colorado, as it gives a mint of most useful information to be gained no other way, on mining matters generally.—[Rocky Mountain News.

The publishers intend to make it the "Scientific American" of the Pacific Coast. Every miner should have a copy of it in his cabin, for it will be filled with useful information to the pick and shovel fraternity.—[Trinity Journal.

It contains correspondence from different sections, giving accounts of new discoveries in gold, silver and copper, and should be taken by every person that wishes to keep well posted on the developments of our State and the Territories.—[Mountain Messenger.

THE MINING PRESS is particularly the miners' journal, and is doing more for the solid interests of the State than any other, by enabling its readers to unlock the mines of untold wealth which lie waste around them.—[Mountain Messenger.

The public should support the enterprise of the MINING PRESS, one of the best papers in the State, by a liberal patronage, as it is only by a system of legitimate reports that our mines can be favorably brought before men of capital below.—[Calaveras Chronicle.

It embraces one of the finest fields in the world, and seems to improve it. * * * It will be second to no scientific record now published on this continent.—[Los Angeles News.

Under the management of Messrs. Dewey & Co., the PRESS has been much improved in every respect. * * It deserves a liberal support.—[Virginia Union.

With the last number is an index to the whole volume, most useful and valuable to those who keep files of that paper.—[Shasta Courier.

Prof. J. D. Whitney's address on Mining, is given entire. * * * We preserve the PRESS, and would like to have a full file.—[Napa Reporter.

THE PRESS is a large, sixteen page paper, and is truly a valuable assistant to the mining interests of the Pacific Coast.—[Nye County News.

We can give our testimony that it is always replete with useful and valuable information to miners and mechanics.—[Placer Herald.

Those who would have a good paper of this character should subscribe now.—[Marysville Appeal.

A good paper for this country.—[Humboldt Register Nevada.

A neat and useful journal. One of the most presentable and useful in the State.—[Sunday Mercury.

Such a journal has been needed on the Pacific Coast. The PRESS fills the bill.—[Reese River Reveille.

A splendid paper, and should have a good list of subscribers in prosperous Grass Valley.—[G. V. National.

Interesting and important to miners and Mountain men.—[Butte Record.

Friends pleased with our efforts in the publication of the PRESS can render us essential aid by furnishing correspondence and all important information which may come under their observation, and by calling the attention of their neighbors to the commendable features of the paper; the appreciation of which favors will be duly manifested by the constant improvement of our journal.

Specimen copies will be sent free to those desiring to examine the paper before subscribing. Postmasters, Express Agents and News-dealers, acting as our agents, will receive liberal commissions.

MINING AND SCIENTIFIC PRESS

PATENT AGENCY FOR THE PACIFIC COAST,

SAN FRANCISCO, CAL.

TO INVENTORS

ON THE

Pacific Coast.

Messrs. DEWEY & CO.

Take occasion to call your attention to the following rules, regulations and suggestions relative to the obtaining of LETTERS PATENT of the United States:

Self-Evident Facts.

Having had large experience, and gratifying success with the great variety of cases emanating on this coast, we feel confident of our abilities to assist inventors in patenting their inventions, saving them from vexatious delays, and from receiving worthless papers hy reason of imperfect proparation of their claims hefore being sent to the Patent Office.

The hranch of Patent Law is of itself a SPECIALITY of legal jurisprudence; or, as Mr Phillips, an eminent Patent lawyer, justly remarked: "The metaphysics of the law."

In enrly days hut little prepnration was needed, or hut ordinary skill required to ohtain a patent; hut now, hy reason of the multiplicity of inventions, and the numerous acts of Congress, found necessary to protect the inventor whilc the patent lasts, and to do justice to the people after it expires, the utmost eare and skill are requisite in managing cases and obtaining a patent that will he of real value to the Patentee, nnd stand the test of passing through the lcgal ordeal of an infringement suit.

The general practice of the Patent office regarding the examination or issue of Letters Patent for inventions has not heen materially changed for many years, yet there have been amendments added to the laws of 1861, 1863 and 1866, and which it is necessary for all parties managing an application to be conversant with. Old inventors invariably advise the employment of none hut agents of *responsibility* and *experience*. As agents with such qualifications, we solicit your patronage.

Confidential Advice.

Those who have made inventions and desire to consult with us respecting the same, are cordially invited to do so. We shall bo happy to seo them in person at our office, or to advise them hy mail, or through the MINING AND SCIENTIFIC PRESS. In all cases they may expect from us an honest opinion. For these consultations, opinion and advice we make no charge. A pen-and-ink sketch and description of the invention should he sent together with a stamp for return postage. Write plain, do not use pencil or pale ink; he brief.

Remember all husiness committed to our care, and all consultations, are kept hy us secret and strictly confidential. Our permancnt business interests demand, as it were, a sacred complinnce with our ohligations as solicitors, and in reference to our strict fidelity in this respect we refer to one and all of the hundreds of inventors and patentees on this coast who have patronized us.

Letters Patent.

A patent is an open letter, embodying all the language of an inventor or his agent, contained in the specification, without alteration, and is granted to citizens of the United States, or those who have declared their intention of hccoming such, and is signed by the Secretary of the Interior and the Commissioner of Patents, with the seal of the Patent Office affixed. Its jurisdiction is for the whole United States, for the term of seventeen years.

A patent right is personal property, and is assignahle, but cannot he seized and sold on execution.

What Claims can be Patented?

A knowledge of Ancient and Modern Mechanics and familiarity with American and Foreign patent issues and rejections, enables us to determine in a measure in nll cases what can he patented, and how much can he elaimed as new and novel, and he covered by Letters Patent. This is one of the most difficnlt questions encountered hy both old and new inventors—one in which an experienced counsel is of great service—and yet it can never be positively determined except hy presenting a formal application for a patent to the Government, embracing a petition, specification, model, duplicate drawings and payment of the first government fees.

Steps Necessary to Procure a Patent.

The FIRST thing required is a model, if your invention can be represented hy one. It is not only immediately necessary in preparing the papers, hut the law demands that the inventor shall, in all cases, furnish a model, which must not exceed twelve inches in any of its dimcnsions. A less size model will answer when more convenient. It should he neatly made, and of hard wood or metal, or both, varnished or painted; the namo of the inventor should he engraved or painted on it in a permanent manner.

When the invention consists of an improvement on some known machine, a full working model of the whole will not be necessary. It should he sufficiently perfect, however, to show, with clearness, the nature and operation of the invention.

As soon as the model is ready, it should be carefully hoxed and shipped hy express, or otherwise, to our address, namely: DEWEY & CO., *Mining and Scientific Press, San Francisco.* Prepay expenses and send express receipt to us by mail.

A full description must also he sent with the model, embodying all the ideas of the inventor respecting the improvement.

Simultaneously with the model, tho inventor should send us the first installment of the Government fee, fifteen dollars. The money may he forwarded either by express with the model, or by mail. The safest way to remit is by draft on San Francisco, payahle to our order. Always send a letter with the model, and also the remittance, stating the name and address of the sender. On the receipt of the model and Government first feo of $15 in currency, the case is duly registered on our hooks, and the application proceeded with as fnst as possihle. When the documents are ready we send them to the inventor hy mail, for his examination, signature and affidavit, with a letter of instruction, etc. Our fee for preparing the case is then due and will be called for. The case will then be presented to the Patent Office, and as soon as the patent is ordered to he issued the Government last fee of $20 in currency will he required. The law states that every patent shall be dated as of a day not later than six months after the time at which it was passed and allowed, and notice thereof sent to the applicant or his agent. And if the final fee for such patent be not paid within the said six months, the patent shall bo withheld, and the invention therein described shall become puhlic property as against the applicant therefor.

Inventors who do husiness with us will he notified of the state of their application in tho Patent Office, when it is possihle for us to do so. We do not require the personal attendance of the inventor, unless it is one of great complication, as the business can be well done by eorrespondenco.

When the invention consists of a new article of manufacture, a medicine, or a new composition, samples of the separato ingredients, sufficient to make the experiment, and also of the manufactured article itself must he furnished, with full description of the entire preparation.

The average time required to procure a patent, when the case is conducted at our agency, is three months. We frequently get them through in less time; but in other cases, owing to delay on the part of Government officials, the period is sometimes extended to four or five months, and even more. We make a special point to advance our cases as rapidly as possihle.

Saving of Time.

In urgent cases for an immediate patent, persons can deposit the amount of the last fees with us, in San Francisco, and have our Washington agent procure the *issue* of the papers as soon as granted, saving the two or three months time which would otherwise be required for the inventor to receive notice and then forward the money. Money advances for this purpose will be returned, should the application he rejected. By adopting this course, we are enabled, with our other advantages, to secure the *receipt* of patent papers to inventors on this Coast, at least four or five months sooner than can he done through agents in the East, without the applicant going to the hazardous expense of sending on the last fee hefore it is known whether the patent will he granted.

Expense of Applying for Patent.

The Government fee, on filing an application for a patent in the United States, is fifteen dollars; and if the patent is allowed, twenty dollars additional is reqnired. If rejected, the first fee of fifteen dollars is all that is demanded. English, French, Austrian, Prussian, Spanish, and inventors of every nationality, may now ohtain patents in the United States upon the same terms as our citizens. The only discrimination made is against subjects of governments that discriminate against the inhabitants of the United States.

To the foregoing official fees must be added fees for preparing the various documents and expense of drawings. Our charge for preparing a case, presenting it to the Government, and attending to all husinoss connected with it, varies from $20 to $40.

Following is the list of Government fees:

On every caveat	$10
On every application for a patent, for seventeen years	15
On every application for a design, for 3 y'rs and 6 mos	10
On every application for a design, for seven years	15
On every application for a design, for fourteen years	30
On issuing each original patent	20
On filing a disclaimer	10
On every application for a re-issue	30
On every additional patent granted on a re-issue	30
On every appleation for an extension	50
On the grant of every extension	50
On appeal to the Examiners-in-Chief	10
On appeal to the Commissioner from Examiners-in-chief	20
On every appeal to the Judges of Circuit Court, D. C.	25

Caveats.

A caveat is a description of the invention designed to he patented, lodged in the Patent Office before the patent is applied for, and while the inventor is perfecting his design. When *properly* made, it operates as a bar to applications respecting the same invention from any other quarter; hut when improperly done, it is inoperative hy reason of such defect. Tho Patent Office always returns a receipt for caveat papers with a copy of the laws governing the same, hut does not seek to point ont its incorrectness, unless there be some glaring defect.

If worth filing at all, these cases should be prepared with very great care and caution.

One inventor on this Coast, who had filed a caveat by an attorney, was, sometime afterward, surprised to find that his invention, which was a very important one, had heen patented nnd was being brought out hy an eastern company with a capital of more than a million of dollars. Upon inquiring at the Patent Office, he was informed that his caveat was inoperative hy reason of imperfections and his not having complied with the law in that case as mnde and provided.

Our fee for the service varies from $10 to $20. The Government fee, under the new law, is reduced to ten dollars. This latter sum does not now apply, as heretofore, as part of the fee on presenting an application for a patent.

Inventors will ofttimes find it very important to take advantago of the caveat system—the expense under the law being comparatively small.

To enahle us to preparo caveat papers, we only require a sketch and description of the invention; no model heing necessary.

If an inventor puhlicly uses and sells his invention, prior to making applicatiou for a patent, he cannot, afterward, prevent others from doing the same thing; and should any party put the invention into use, before such application for a patent is made, they could continue to use tho specific machine or composition of matter after the patent is issued to another. Filing a caveat does not give the right to affix the words, "Patented," or "Patent applied for."

Patent Rejections.

First. Refusals are always made hy the Patent Office if there is any informality in the specification, or if it does not contain tho entire subject matter of the invention, and is not properly arranged and stampcd. A slight omission often proves fatal.

Second. If the drawings are defective, and are not executed in an artistic manner in India ink, and on sheets of the required sizo, they are subject to rejection.

Third. Applications aro always rejected where the claims conflict with others already patented.

If the rejection should he an unjust one—which sometimes happens—it can generally he reversed, and the patent ohtained hy contesting the case.

For the prosecution of such cases, ohtaining references, making arguments, and personally attending to explain the case (through our agent in Washington), *we charge no second fee,* as is the case with some agencies, hnt attend to the business till finally allowed or rejected, without extra charge, beyond the Government fee.

Inventors who have rejected cases, prepared either by themselves, or for them by other agents, and desire to ascertain their prospects of success by further efforts, are invited to avail themselves of our unsurpassed facilities in securing favorablo results. We have been successful in securing Letters Patent in many such cases. Our terms are very moderate.

Advantages to Patrons of Our Agency.

Some of the advantages to he ohtained hy patronizing us, may be enumerated as follows:

1. Inventors on this Coast having their applications for patents made out through our agency can sign their papers at once, and thus secure their rights at least *three months sooner* than by trusting the same to distant agencies, situated at New York or Washington.

2. As many of the inventions conceived here are especially adapted to the Pacific Coast, they should be properly hrought out here, which can he accomplished (if the invention is a meritorious one) hy illustrating the subject, with a careful description, in the colnmns of the "Mining and Scientific Press," *free of charge;* tho inventor paying simply for the engraving, which will he executed at a moderate charge. The same cnts can he subsequently used for hooks, letters, or circulars. In a word, we are determined to make it of decided interest for every inventor on this Coast to patronize home talent and enterprise.

3. Most inventions on this Coast are for objects and purposes hut little understood by parties at Washington or other parts of the East. Our mining machinery, processes and operations are hest understood hy those familiar with their use; and a personal, verhal explanation is oftentimes of important service, and enahles us to he more successful than agents generally.

4. Remittances of money made hy individual inventors to the Government sometimes miscarry, and it has frequently happened that applicants have not only lost their money, but their inventions, also, from this cause and consequent delay. We hold ourselves responsihle for all fees entrusted to onr agency. By sending duplicate correspondence to our Washington agent we avoid hazardous delays.

Dangers of Delay.

Situated so remote from the seat of Government, delays are even moro dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuahle patents may he lost hy the extra time consumed in transmitting specifications from Eastern agencies back to this Coast for the signature of the inventor, or by reason of return for amendment when addressed directly hy the inventor to the Government.

Re-Issues.

When, through "inadvertance, accident, or mistake," an *insufficient* or *defective* patent has been issued, the defects in the Specification and Claims can bo cured hy a *re-issue.* In order to obtain this, the inventor, or the holders of the patent, must snrrender the patent, and file an amended specification and drawings, and a statement specifying tho ground for asking for a re-issue. Re-issues are generally applied for nfter it has been found that the patent could not withstand litigation. It is, therefore, cspecially desirable that the new Specification and Claims should he prepared with great care and skill. Terms liberal in theso cases.

Foreign Patents.

In addition to American patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant patents, including Great Britain, Franco, Belgium, The Netherlands, Prussia, Austria, Russia, Spain, British India, Saxony, Hanover, Sardinia, Norway, Sweden, Australia, Mexico, Victoria, V. I.

Many valuablo and important inventions of Americans are being yearly surreptitiously patented in foreign countries, some of which governments allow it, thus debarring those who have valuahle inventions from their rights.

Patents ohtainod in England, France and Belgium, will secure the rights of an inventor among many millions of the most enlightened peoplo on the globo; it is thereforo very important, if the invention is valuable, to secure foreign patents.

Our schednle prices for ohtaining foreign patents, in all cases, will he as low, or lower, than those of any other agency.

To Eastern Inventors.

Our close proximity to Mexico, Australia, and the Islands, enahles us to obtain Letters Patent for yon with much less *delay* and expense than they can be secured through any other agency in the United States.

Comparatively few inventors seem to be awaro that Melhourne, in Australia, is a city nearly double in size to San Francisco, hesides the adjacent colonies of great commereial and mineral importance. Inventions of all kinds, hut especially those relating to the saving of gold and silver, if secured in Australia, will often prove of great value. We have competent agents there, and can promise that the husiness will be attended to with fidelity and dispatch.

DEWEY & CO.,

Patent Solicitors, Mining and Scientific Press Office,

505 Clay Street, San Francisco.

ESTABLISHED] [MAY, 1860.

VOLUME THIRTEEN

—OF THE—

Mining and Scientific Press,

COMMENCING JULY, 1866.

DEWEY & CO., Publishers.

Issued every SATURDAY, at our Book and Job Printing Office, **505** Clay street, corner of Sansome, SAN FRANCISCO.

Terms in Advance:—One year, $5; Six months, $3; Single copies, 15 cents; Monthly Series, $5.50 per year, or 65 cents per number. Back Volumes from January, 1864, $3 per volume; bound, $5 per volume.

The MINING AND SCIENTIFIC PRESS is now thoroughly established, and enjoys one of the largest and most permanent subscription lists of any weekly journal on this coast. The individual character and reputation of its constant patrons throughout the entire coast is one of the best recommendations of its merits and value as a medium of intelligent progress and prosperity.

Geological Queries.

MESSRS EDITORS:—Will you be good enough to submit the following to the readers of your valuable journal:

From theoretical considerations, I deem it possible that those ancient gravel beds, situated on the western flank of the Sierra Nevada, may be intersected by quartz veins, along anticlinal lines. I wish to ask the readers of the PRESS if any one of them ever saw or heard of a quartz vein intersecting the gravel composing such deposits? If so, where is the vein located, what is its width, and is the gravel in immediate contact with the vein, metamorphosed; and if so, to what extent? If any one can answer in the affirmative, he will confer a favor on the writer and at the same time contribute his mite towards the advancement of the science of our day.

I fully agree with O. W. Easton, that we have anthracite coal buried deeply in the valleys of California, providing the troughs or basins existing between the mountain ranges were not submerged during the carboniferous era.

F. A. H.

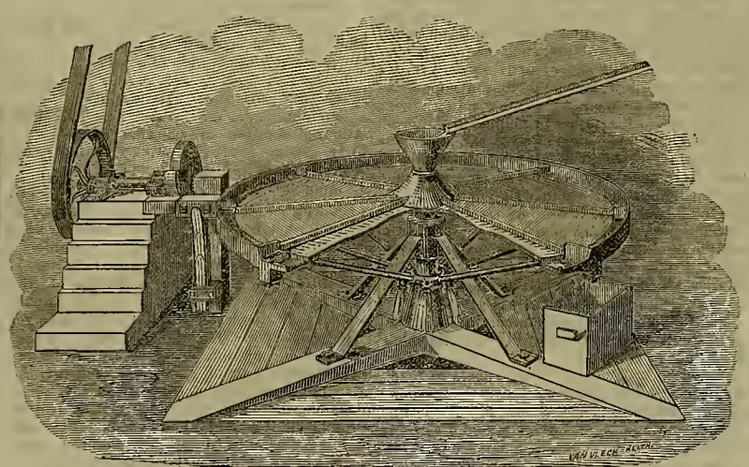
Forbestown, April 3d, 1866.

REMARKS.—We give our correspondent the benefit of the above query; but venture the assertion that he will never find "a quartz vein intersecting the gravel composing" the "ancient gravel beds" of California; neither in the fresh water deposits which are now being worked for their auriferous treasures, and which, according to Professor Whitney, belong to the post-pliocene epoch; nor yet in the much more ancient deposits of marine origin, which are formed, at intervals along the base of the Sierra, and which are referred to an age as far back as the older tertiary, or perhaps even to the upper cretaceous system. Conglomerates, made up of small boulders and water-worn pebbles, imbedded in what was once a pasty, but which is now an indurated mass, and of a much more ancient origin than the cretaceous rocks, frequently have small quartz veins intersecting them in direct lines, often cutting the boulders and pebbles in whatever line or section the direction of the vein chances to strike them, as for instance in the vicinity of Boston, Massachusetts; but we have never heard and never expect to hear of a quartz vein intersecting a gravel range deposited during the post-tertiary age to which, if we understand our correspondent, the deposits to which he refers belong.

MACHINERY OIL.—Dell, Cranna & Co., 513 Front street, advertise a very excellent quality of machinery oil, said to be superior to anything of the kind in use on this coast. Machinists would do well to give them a call. This firm imports coal oils and lamp stock.

VARNEY'S CONCENTRATORS.

There is probably no class of mining machinery at the present time, to which inventors can turn their attention with so much profit to themselves and the public, as to that having for its object the separation of the small percentage of sulphurets from the large mass of quartz, or other silicious matter contained in the ore. It is now universally admitted that the chief source of loss in working both auriferous and argentiferous ores is the waste of the sulphurets. Within the last few years considerable attention has been devoted to perfecting machinery for accomplishing this desired object. Various machines have been devised for this purpose, several of which have been illustrated in the columns of the MINING AND SCIENTIFIC PRESS; and in accordance with our determination to present our readers with everything new and valuable in mining machinery, we give to-day an illustration of another concentrator, recently devised and patented by Mr. Thomas Varney, of this city a gentleman already widely and favorably known to the mining public by his previous inventions of mining machinery.



VARNEY'S CONCENTRATOR.

The Varney Concentrator is quite different in its construction and mode of operation from anything of the kind hitherto devised. In the illustration which we give, the artist has broken away a portion of the machine, in order to give the reader a more clear comprehension of its general construction. The machine consists of a horizontal, circular disk, slightly conical in form, from four to eight feet in diameter, divided into eight compartments, more or less, according to the size of the disk. These divisions are made by radial partitions slightly raised above the surface. The surface of each compartment is covered by quicksilvered copper plates, for the purpose of catching any free gold that may have escaped the previous saving apparatus. Around the periphery of the disk is a slightly raised flange or ledge forming the outer edge of a series of troughs, one of which is placed just below the outer edge of each compartment. The sand is fed into the machine, as shown, at the center, and in such a manner as to be equally distributed over the entire surface. Projecting from the left of the circumference of the disk, will be noticed a short arm resting against an upright steel spring. The machine is set in motion by revolving a small wheel, with a projecting cam, which, striking against the arm attached to the circumference of the concentrating disk, throws it forward an inch or less, from whence it is forced back by the spring against a percussion post or stop, permanently fixed in its position. This, it will be observed, gives a vibratory motion to the disk, which can be made as rapid as may be required.

The force of the water carries the sand outward in every direction from the center of the disk, and the vibratory motion with its accompanying percussion, lodges the heavier particles against one side of each of the partitions which divide the disk into sections; while the lighter portion spreads out, according to the specific gravity of the particles, toward the opposite sides of the compartments or sections, and the action of the water, aided by gravity, discharges the entire mass upon the troughs before mentioned, when the continued oscillating motion and percussion causes the heavier particles to discharge through an opening at one extremity of the trough, from which it falls into a proper receptacle—one of which may be seen in the engraving—while the lighter and worthless sands pass off with the water through an opening at the other extremity, by a suitable conveyance to the waste way. The operation is most complete, and the machine extremely simple. All the care required is the removal of the vessels into which the sulphurets are discharged, as fast as they are filled. This machine can be seen in operation at the rooms of the inventor, at the Pacific Iron Works, on First street.

THE CORRECT DIMENSIONS.—The Western Union Company's light-draught stern-wheel steamers Wade and Windsor, recently built in this city for the use of telegraph builders, are sixty-one feet long and eleven feet beam, instead of forty feet long and nine feet beam, as stated by the *Alta* recently. The machinery was furnished by Mr. John Lochhead.

[Reported for the Mining and Scientific Press.]

California Academy of Natural Sciences.

REGULAR MONTHLY MEETING.

MONDAY EVENING, May 21, 1866.

The Academy met for the first time at their new rooms in Donahue's Bank Building, south-east corner of Montgomery and Sacramento streets.

Twelve members present—Vice President Stearns in the Chair.

Minutes of previous meeting read and approved.

The Committee on Rooms reported that rooms had been obtained, fitted up by a private subscription outside of the usual funds of the Academy, and the library and collection moved and partially arranged. The Committee having concluded their labors, were relieved, at their own request.

The Curator of Conchology announced that the Academy had received from the Smithsonian Institute, two boxes of shells, containing duplicate shells of the U. S. Exploring Expedition, and the shells of this coast, named from the types in the Smithsonian Collection.

The Librarian announced the reception of a large number of very valuable scientific works, received through the Smithsonian Institute, from various scientific societies in Europe.

It was proposed by several members that the Academy should subscribe to the various metallurgical and mining journals now published on the continent of Europe, and not accessible to the mining engineers and metallurgists of this State. Messrs. J. D. Whitney, W. Ashburner and others, pledged themselves for the amount necessary to meet the subscription for the same, and the proposition will doubtless be carried out immediately.

A paper was presented by Mr. W. H. Dall, proposing a new sub-family for the reception of *pompholix effusa lea*, a rare fresh water Californian mollusk, under the name of *pompholinæ*; it was referred to the Publication Committee.

Messrs. Frederick Gulzkow, I. T. Gardiner, Hugo Hoebolzer, C. W. Lightner, Charles Bonner, W. A. Goodyear, Theodore Blake, and C. R. King, were proposed for resident membership.

The Publication Committee called attention to a new sheet of the Proceedings containing a very valuable paper by M. Auguste Remond, on the "Mines and Geology of Northern Mexico." This paper contains a more complete account of the geology and mines of that country than has been given in any or all previous publications on the same subject. The paper is the result of two years arduous and careful explorations made in person by Mr. Remond, who is the first to collect fossils proving the age of the metalliferous and other deposits in those localities.

Prof. Whitney spoke of collections of fossils made in Nevada by Mr. J. E. Clayton, containing many new forms of fossils, among the most remarkable of which is a trilobite. They are extremely valuable, as throwing light on the geology of both California and Nevada.

Sundry bills presented and ordered paid. Adjourned.

T. H. BLOOMER, Secretary.

WE have to beg the indulgence of our readers for the absence of the usual mechanical and scientific miscellany from our columns, which must have been observed for several weeks past. The amount of correspondence which ordinarily finds its way to our table, has been considerably increased of late, by a somewhat lengthy discussion, which, we presume, has now been brought to a close. Its place, and more, will hereafter be supplied with matter presenting greater variety and more general interest. We trust that our correspondents will, in all cases, endeavor to be as brief and as much to the point as possible in their communications.

Communications.

In this Department we invite the free discussion of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

New Process for Reducing Silver and Copper from their Ores and Solutions.*

BY DR. LANSZWEERT.

Berzelius (tom. 4, page 144, second edition) has proposed to prepare certain proto-salts of copper by the salts of silver. "It is probable," he says, "that the best way to prepare the oxy-salts of copper is to decompose the chlorids of copper by neutral salts of silver." The simultaneous solubility of several proto and bi-salts of copper; also of different salts of silver in ammonia; the existence and the stability of some proto-salts of copper in an excess of ammonia; and the reduction of most of the salts of silver by these same proto-salts of copper, always in the presence of ammonia, are facts worth our attention.

The reciprocal action of the solutions of proto salts of copper and silver, saturated with ammonia, leads us to the interesting fact that the salts of copper have a value for the extraction and refining of silver. When a bi-salt of copper is dissolved in a large excess of ammonia and this liquid, of a more or less intense blue color, is thrown on metallic copper, freed from the air, we observe that all the bi-salts really soluble in ammonia, nitrate, sulphate, phosphate, acetate, oxalate, tartrate, chloride, etc., dissolves a certain quantity of copper; producing proto-salts, difficult to isolate, notwithstanding that they manifest, sometimes, their presence, by a complete discoloration of the solution. But when the discoloration is not complete, the existence of proto-salt can always be shown by dropping the ammoniacal copper solution in an aqueous solution of the acid of the copper salt.

Thus in reducing the ammonio-sulphate of copper by metallic copper, and pouring this solution in diluted sulphuric acid a precipitate nearly white appears, which colors immediately dark yellow, then red, and as final result of this reaction, we find that metallic copper and sulphate of the bioxyde is formed. The copper thus precipitated is amorphous and of an extreme tenuity, possessing the red color of pure copper, which it loses by exposure to the air; but by friction again takes its metallic luster. This reaction is obtained by most of the acids. The nitrate, phosphate, oxalate, sulphate, tartrate, experimented with, all give less or more rapidly metallic copper. The chloride and acetate are distinguished from the above by producing a fixed proto-salt. When the acetate of the bi-oxyde of ammonial copper, reduced by a more or less continued contact on metallic copper is poured into concentrated acetic acid, a white precipitate is obtained in the form of small clustered prisms, which retain their form long enough to be examined, although they are rapidly disintegrated by contact with the atmosphere. With the bi-chloride of copper, obtained and in the same conditions, a white proto-chloride is precipitated, of a more fixed character.

Proto-chloride of copper is not only produced by the reaction of the ammonio bi-chloride of copper, but also more abundantly when ammonia is replaced by chlorhydric acid or chloride of sodium.

Twenty-five centimetres cubes of a colorless solution of proto-chloride of copper, obtained by the action of metallic copper in a solution of bi-chloride of copper in concentrated chlorhydric acid, has given, by the ordinary modes of analysis 2.63 grms of bi-oxyde of copper, or 9.33 grms of metallic copper per litre. This solubility of proto-chlohride of copper is only obtained by a large excess of chlorhydric acid, as a litre of the same solution contains 235.8 grms of chlorine.

Ten centimentres cubes of a solution of proto-chloride of copper, obtained on metallic copper, in a solution of bi-chloride of copper with chloride of sodium bas given a quantity of bi-oxide of copper corresponding to 135.4 grms of metallic copper, by litre of solution.

The quantity of proto chloride of copper obtained by ammonio bi-chloride of copper through metallic copper, varies very much and according to the strength of the ammonia used.

By ammonia at 18 deg. Cartier, a liquor was obtained giving 92.8 of metal in the state of proto-chloride. With ammonia of 21 deg. the quantity of copper, as proto-chloride, was as bigh as 139.8; ammonia at 18 deg., diluted with its volume of water, did not furnish over 74.4 of copper per litre of solution. The weight of the proto-salt in solution can be considerable, even when the solution is still of a deep blue. The coloring power of the bi-ammoniated salts of copper is very great; as it can be shown that the difference between the quantity of copper as proto-salt and the amount of metallic copper was only a fraction of a gramme in the solution still colored.

It results from the above facts that bi-bichloride of copper, to which is added ammonia of 21 deg. constitutes the proper menstruum to concentrate proto-salts of copper. For this reason, and the stability of the solution, it has always received the preference in the reduction of the salts of silver. If it is desired to obtain pure proto-chloride of copper, a solution of proto-chloride of copper in chlorhydric acid should be preferred, which precipitates by the addition of water, a white crystalized proto-chloride.

We will now examine the reaction of the salts of silver dissolved in an excess of ammonia. In pouring a solution of ammonia proto-chloride of copper into a solution of ammonio nitrate of silver a precipitate of absolutely pure metallic silver is immediately obtained, and the following particulars are observed:

The precipitated silver is in an amorphous state and in such minute division that the diameter of each atom does not exceed 0.0025 of a millimeter. Silver obtained by galvanic action or through metals, is commonly brilliant and chrystalized. The amorphous silver is of tarnish gray; sometimes white; but in all cases of the most vivid metallic luster, when burnished; and through its finely divided state, it is easily applied to various substances, such as wood, stone, leather or other tissues.

As silver thus obtained is pure and divided, its application in various industries might be made useful. To show the advantages to be derived from this reaction, such as extracting, purifying or gilding silver; or to obtain a more correct analysis of the compounds of copper, it should be borne in mind that the reaction takes place between the acting principles in the proportion of their chemical equivalents.

Thus by the weight of the precipitated silver the correct quantity of oxyde of copper is determined, no matter whether the proto-salt is pure or mixed with bi-salt. We have thus a new and perfectly correct method by which to analyze a mixture of proto and bi-salt of copper, and thus are able to avoid all the uncertainties which have hitherto attended the assaying of copper ores.

The following cases, where correct analyses are difficult to be obtained, will show the value of the above process:

When bi-carbonate of soda is made to react on proto-chloride of copper (avoiding the contact of the atmosphere) a red powder is obtained, easy to dry, and which is not a carbonate as is generally supposed; but a protoxyde of copper which oftentimes precipitates other substances. The amount of copper contained in this compound gives, by the ordinary method, 83.42 per cent. of metal To determine, by the new process, in what state the copper combined in this compound existed, 0.561 grms were treated with a solution of ammonio chloride of silver. The weight of the precipitated silver obtained was 0.800 grms—a number corresponding to 0.235 grms of copper, which, multiplying by 2 gives 0.470 or 83.6 per cent. of metallic copper—nearly corresponding with 83.42, found by the previous method. All the metal is thus in this compound in the state of proto-oxyde.

To obtain correct results some precautions should be observed which practice very soon teaches. Thus when the compound to be analyzed is chrystalized it should be reduced to an impalpable powder before being placed in the matrass in which the reaction is to take place, and which must be at least of a capacity of 200 centimetres cubes. When placed in the matrass it should first be covered with water, on which should be carefully poured ammonia, taking care that the latter does not come in contact with the substance to be treated; then by the aid of a long pipette, which reaches to the bottom of the matrass, the ammoniated silver solution should be placed in direct contact with the pulverized substance. Care should also be taken that the matrass is full, then closed and shaken. If these precautions are neglected, the oxygen of the air will intervene and diminish the weight of the precipitated silver. It should furthermore be observed that cyanide of silver cannot be reduced by proto-salts of copper; and that the presence of the sulphocyanides, iodides, and hypo-sulphites also prevent the reaction and are exceptions to this process.

The study of copper compounds is accompanied with difficulties against which chemists have long contended; but which are completely obviated by the use of this new method of analysis.

In proof of the correctness of the foregoing, it will be found that if the copper compound is used in proper proportion to the amount of silver contained in solution, all the silver will be precipitated from its solution. For example, take the following experiments:

First.—1.115 grms of pure silver dissolved in nitric acid, and saturated with ammonia. To this add a solution of proto chloride of copper, also saturated with ammonia, and wash dry and weigh the precipitate, which will give 1.114 grms or 99.91 per cent. of metallic silver.

Second.—0.588 grms of silver treated the same as above, gave 0.5855 grms of silver or 99.57 per cent of silver.

Third.—0.9827 of the same metal, treated the same way, and precipitated by the ammonio chloride of copper, gave 0.983 grms or 100.03 of silver in place of 100.

This process gives the silver in such an easy state to collect and weigh that the analysis of silver compounds, by this method will be found much simpler and more quickly effected.

To determine the solubility of chloride of silver in various liquids, pure ammonia of different degrees of strength are employed; also ammonia to which was added an aqueous solution of chloride of ammonium, potassium, etc.; besides solutions of the chloride of silver, in other chlorides, without the addition of ammonia. For the precipitation of the silver in the metallic state proto chloride of copper, strongly ammoniated, was used, and the numbers in the following table give the quantity of metallic silver obtained from a litre of solution:

Solvents of Chloride of Silver.	Am't of Metallic Silver per litre of Solution.
Ammonia 18° Cartier	51.6 grms.
Ammonia 18° do with its volume of water	23.8 grms.
Ammonia 22° Cartier	58.0 grms.
Ammonia 26° Cartier	49.6 grms.
Ammonia 18° Cartier diluted with its volume of saturated solution of chloride of sodium	20.8 grms.
Ammonia 18° Cartier diluted with its volume of a saturated solution of chloride of potassium	20.4 grms.
Ammonia 18° Cartier diluted with its volume of chloride of ammonium	22.4 grms.
Saturated solution of chloride of sodium	1.2 grms.
Saturated solution of chloride of potassium	0.5 grms.
Saturated solution of chloride of ammonium	1.2 grms.

Chloride of silver is insoluble in chloride of calcium or zinc. The above numbers have been obtained by using the curdy chloride of silver; the difference in using fused chloride is very little, admitting the solubility of the former chloride as 49.6 that of the fused would be 48.4; in this latter state it takes a longer time to dissolve. The above table shows that 58 grms of chloride of silver are easily dissolved in ammonia of 22°, which is usually the commercial strength of this article. It seems plausible, therefore, that silver ores converted into chlorides could be more easily and cheaply reduced than by the use of mercury. The residue of silver of the laboratories and assay offices are so promptly reduced by this process that no other will eventually be resorted to.

A litre of ammonia, saturated with chloride of silver, would be precipitated by 230 centemetres cubes of ammonio solution of protochloride of copper, at its maxium of concentration. The precipitant should always be maintained in excess; and, therefore, it shows that the same quantity of copper would be used indefinitely for this purpose. The chloride of copper obtained should be reduced by zinc, which is easily done in the ammoniated solution, and thus metallic copper obtained, necessary to the formation of the protochloride. Furthermore, ammonia could be reproduced by lime, and brought to the proper degree of strength. It seems useless to dwell upon the simplicity of this novel process as applied to the refining of silver.

*Collated from the "Moniteur Scientifique."

Why will the emblems of America outlive those of England, France, Ireland or Scotland? Because the *Rose* will fade, the *Lily* will droop, the *Shamrock* wither, and the *Thistle* die; but the *Stars* are ETERNAL.

To DREAM gloriously, you must act gloriously while awake; and to bring angels down to converse with you in your sleep, you must labor in the cause of virtue during the day.

One of our exchanges says: "Dr. Joseph Worcester, author of a dictionary, and inventor of Worcestershire sauce, is dead." Such is fame.

"Have you seen my black-faced antelope?" inquired Mr. Lowcope, who has a collection of animals, of his friend. "No, I hav'nt. Who did your black-faced aunt elope with?"

[Written for the Mining and Scientific Press.]

Letter from Placer County.

THE BANKER MINE.

EDITORS PRESS:—The Banker mine is the name of a truly remarkable lead, of which I send you here a brief description, which I think will prove interesting to your numerous readers. The above-named mine is situated in the county of Placer, four and a half miles from Lincoln, in an northeastern direction. The locality was formerly called Whisky Diggings, but its present owner, going in pace with our more civilized times, which have brought into desuetude such names as Hangtown, Murderer's Bar, Jackass Gulch, etc., has named this place Valley View; and a very appropriate name it is, since from here one can see at a glance the greatest part of that former inland sea, called the Sacramento Valley. The whole Coast Range, intercepted only by the Marysville Buttes, is plainly visible, and forms a fitting frame to this grand picture.

In the origin it was called the Baker Copper mine, and incorporated; three years ago it was opened under the efficient superintendence of J. C. Crosby, Esq., and it was whilst hunting for copper that a streak of gold-bearing rock was found alongside the copper ore, at a depth of about sixty feet from the surface. The mine came then under the notice of A. Harpending Esq., who thought there *was something there* and he acquired the title to nearly all the ground by purchase.

The ground claimed extends a thousand feet in length, and comprises all that is apparently valuable. The length of the mine is much easier to define than its width, and I am tempted to say that it is as wide as it is long. But I think I can affirm, without fear of being taxed with exaggeration, that the pay rock extends on a width of two hundred and fifty feet. First, let me say what constitutes pay rock in this instance.

This mine has a double and very distinct character; there is a gold mine and a copper mine in the same ground; the top or outcrop, to a depth of over seventy feet, is a true copper gossan or decomposed iron hat, such as is found over most all the mines of Cornwall and Devonshire, which yield copper pyrites or yellow copper ore. The same class of rock is found in the surface of the copper mines of Copperopolis, such as the Union, Keystone, Calaveras, and especially the Webster mine, three miles south of Copperopolis; also, at the Newton, and Dotie, and Randall mines in Amador county; also some of the Campo-Seco mines. The only difference is, that where there is in the above-named mines a few feet in width of this gossan, it has assumed here colossal proportions both in depth and width. The only mine in the State which bears much resemblance to this is the Hughes mine in Gopher District, Calaveras county. In this instance, I cannot do better than quote the very language used by Prof. Whitney in his work on the "Noted Mines of the World;" it applies so closely to the Banker mine that it seems to have been written as a description of this same:

Among the first things to be noticed is the decomposed state of the upper portion of the veins, giving rise to what the miners call "gossan," which usually forms the back of the productive copper lodes. This substance is, all over the world, looked upon as a favorable indication of valuable ores at some depth below. It is a mixture of quartzose matter, more or less mixed with oxide of iron, and usually contains traces of other metals in the shape of oxides, carbonates and sulphurets, as would naturally be expected, since it is in all cases the result of the decomposition of copper and iron pyrites, and other sulphureted ores which formed the original vein. The sulphuret of copper is oxidized into a sulphate, which is soluble in water, and is carried away in the streams and by the rains, while the iron remains as an insoluble hydrated oxids. If there was gold or oxide of tin in the veinstone, it remains in its original form, and is generally concentrated together.

The vein runs northwest and southeast; the incline is nearly northeast at an angle of about seventy degrees, so far as known. The mine has been opened in the start by means of two shafts, one of which was sunk at the southern

end to a depth of eighty-five feet, and another nearer the north to a depth of sixty five feet, not to mention other smaller shafts and cuts. Out of the latter a large quantity of rich red and black oxides, green and blue carbonates, and some copper smut (popularly called in this country black oxide), were taken and shipped to Swansea. But they committed here the same fault that was committed in so many mines in this State—they started a big enterprise with little money, and just when the ground looked the most promising, all work had to be suspended.

At present little is being done to develop the copper mine, and all the energies of the proprietor are directed toward the working of the gold-bearing rock, which is done by means of an open cut which taps the foot of the hill, and widens out at a depth of a hundred feet into a regular quarry; the whole hill is now being breasted away, thus affording extraordinary facilities for extracting rock cheaply; a ten is mined and carried to the mill for about twenty-five or thirty cents. The rock is very docile to extract and crush. Three white men and four Chinamen take out from forty to fifty tons a day; a 5-stamp mill crushes that quantity in twenty-four hours; stamps weigh 400 pounds; eighty drops a minute. For the present, two of Moore's pans and a peculiar system of aprons and riffles are used to save the gold; but the whole mill is now going to be remodeled, the battery will be improved, and thirteen large-sized Baux & Guiod's pans need to save the precious metal. After a series of trials these pans have been found to be the best adapted to this rock, and let me say, *en passant*, that I think that it is the *best pan out*.

The rock contains an average of fifteen dollars per ton in free gold; most of it very fine; it amalgamates quite easily when properly brought in contact with quicksilver. Silver varying from one to three dollars per ton has been extracted also by means of the Baux pan; it has not as yet been ascertained whether the silver is contained in the shape of sulphurets, or in a free or native state. Considerable free silver has lately been discovered on the hanging wall of a vein of true gray copper and copper smut.

The mine, or rather the quarry, as it stands, shows an excavation of eighty feet long and thirty wide on an average, presenting a perpendicular face of forty-five feet elevation, which increases as the rock progresses into the hill. It presents a very interesting and unique sight to a professional man. Numerous and varied stratifications are laid bare, offering a rare opportunity of study, since the quarry is open, so as to intersect in some place and follow in others the different veins of carbonates, sulphurets, pyrites, decomposed gossan, talcose sluto, quartz and serpentine.

It is the intention of Mr. Harpending to start a new level, which will attack the mine at a depth of twenty-five or thirty feet below the actual working; the new mill will be placed in a different site, so as to feed from this lower level; most all the *horse* and extraneous matter seems to run out at the foot of the present working; it bears evidence of being mostly country rock and sedimentary matter, washed and thrown into accidental cracks or openings of the surface.

There is hardly any limit to the quantity of rock that could be furnished for milling purposes, since this copper gossan stands pre-eminent from the surrounding country, and could be opened on three sides at once. As the mine now stands, I think that three 20-stamp mills could be furnished each with 150 tons of rock every day during several years, without requiring any hoisting of rock. The gold-bearing gossan extends much below the present workings, and from the dump piles of the different shafts I ascertained that it goes beyond a depth of fifteen fathoms.

I entertain a very favorable opinion of this mine for copper; that there is a true and powerful lode of copper ore at a certain depth I have not the slightest doubt. Now, as to what the percentage of the ore will be, that is a point which can only be solved by actual working. I understand that serious and energetic work will be done this summer to develop the copper interest of the Banker mine. If a body of copper pyrites of a reasonable width, containing from ten to sixteen per cent. of copper, is struck, it will prove remunerative, since the Marysville railroad passes within four miles from here, and ore could be shipped to San Francisco for about five dollars per ton.

Another mine of the same character has been lately discovered by Mr. Harbin, about five miles from here, in a southerly direction; it is owned by the above-named gentleman and Messrs. George Hearst and A. Harpending; a 10-stamp mill, with a number of Baux & Guiod's pans will be erected on the mine this summer.

Let me conclude in calling earnestly the attention of the copper miners of this State to this mine. Gossan is found on most of our copper mines; it all contains more or less gold, and is easily extracted and worked. That fact has long ago been ascertained in England and many other parts of Europe; testimony to that assertion is also found in one of Prof. Whitney's works. I suppose that the reason why, in many cases, it has not been worked out, is that the removal of a large part of the upper crust of a mine opens it too much to the incursions of the pluvial waters, and hinders the working in depth for copper. R.

Valley View, Placer County, May, 1866.

[Written for the Mining and Scientific Press.]

From El Dorado County.

BY OUR TRAVELING CORRESPONDENT.

[Continued from Page 306.]

Messrs. Editors: An imperfect tracing of some of the mineral features of that portion of El Dorado, lying between the Middle and South Forks of the American river, having been made in former letters, before entering upon those of Placerville and immediate vicinity, we would introduce you without further ceremony to the old town of Coloma, the oldest mining camp of the State. It was here that little gold nugget was found, which, in a moment as it were, infused new life into trade and charmed States into being. Here too is the home of

MARSHALL,

Who, in justice, may be styled the Columbus of the mineral world, and who still lingers here around the spot of his early hopes, not much the richer I fear from his valuable discovery. Cordially received at his cottage, I listened with avidity, almost *tearfully*, to the story of his checkered career, and could scarcely help thinking that a handsome *annuity for life* would be a happier expression of sympathy than a tear at the grave. Like most of his neighbors, he was found engaged in cultivating the vine, to which the soil here, as well as in large districts adjacent, seems peculiarly adapted; so that the wine interest of the county is daily growing in importance, (a company having been organized, with headquarters at Placerville, to foster its growth), and bidding fair as a source of wealth to rival the almost fabulous products of her former gold placers, or the well-founded hopes for the future from many an unexplored mineral vein or ancient river bed, to which we now return.

THE DANISH CLAIM,

So called because owned by Peterson and brother, natives of Denmark, lies to the north of the river in full view from Coloma, and her terraced hills in the back-ground; and with the exception of a small but somewhat hopeful vein on the bluffs a little eastward, is the only quartz claim now worked within a circumference of several miles. The surface at the base of the mountain has been sluiced off up to the vein, laying a portion of it bare, although to no great depth. At the points exposed it appears to be dipping very fast to the west, with granite overlying and talcose slate underneath on the east.

This claim has paid somewhat irregularly, but at times extravagantly, yielding about one year ago from a run of three days, the snug little sum of $27,000, and paying fair wages from that time until the present.

SURFACE AND GRAVEL CLAIMS

Are still found on each side of the river, some of which are believed to be as promising as those of Coloma's palmiest days—her streets not actually paved with gold, but overlying rich mineral deposits, such as are now being opened at Uniontown, one and a half miles below in the

NORRIS CLAIM.

It covers an area of 300 to 400 feet square, planted with fruit trees which are about to be undermined for speedier and greater returns in the form of the precious metals, which will doubtless be the result in this particular instance, although it frequently occurs that good agricultural land is ruined for ages by surface mining, where one or two crops of hay, grain or fruit from the soil would be of far more value than the yield from the gold, and at the same time turned into coin with less labor and cost. Mr. Norris, who owns the claim in connection with his sons, informed me that the ground adjoining below worked at the rate of $5 to the pan. While present, one pan was washed out which contained about $1. It has prospected as high as $4.30, and the work has but just commenced.

COLD SPRINGS.

After leaving Coloma, I hurried through Gold Hill and Cold Springs in a drenching rain to this place, taking no note of quartz, except one or two good looking copper lodes, owned and worked by a Santa Clara company, the notes of which having shared the same fate with myself, became too much dilapidated to be readable. This much I remember that they have 20 per cent. ore, not yet in sufficient quantity to pay in the lode where their machinery is erected, and a shaft on it of about 110 feet in depth. A larger parallel lode belonging to this company, with equally good, if not better copper indications, had been brought to view by a bed-rock sluice, not an uncommon mode of saving the gold, where the conditions are suitable for its employment.

PLACERVILLE AND SURROUNDINGS.

While here I have had but little opportunity of examining the quartz lodes, some of which paid, in days past, large dividends; one of these, the Pacific, having a mill upon it, but not now at work; and is considered here, a valuable mine if worked to advantage.

THE NEW YORK HARMON G. & S. M. CO.

Have a promising lode a quarter of a mile from this place, which has yielded large amounts in the past, but not having the statistics before me, I cannot state the figures.

The shaft on the lode is more than seventy feet in depth, five feet by eight, partitioned and substantially curbed. The pump in use is one of six inch bore and three foot stroke. As a large amount of water was in the mine, I did not deem it advisable to venture down, but I learned from Mr. Epley, the efficient superintendent, that the lode was at least four feet in width, having black slate on the hanging wall and greenstone on the other. The quartz last taken out was a good deal decomposed, mixed with small sulphurets of iron, showing some fine gold, with some dark colored scums running through the larger pieces of quartz, giving good marks of a mineral character. The company have put up a 15-stamp mill, which is well built and in good running order, propelled by an engine of 45-horse power. I here first saw a couple of Little Giants, sometimes called the Douglas Cracker, which I had not the pleasure of seeing in operation, as their services had not yet been called into requisition. At least fifty tons of ore can be taken out per day, which, as I was informed, will be done before this article shall appear, and if the yield is not over $10 per ton—a low estimate probably—this mine will soon become very valuable property, owing to cheapness of labor, facilities for mining, accessibility and other causes unnecessary to mention.

There are other claims in this neighborhood to which we cannot now allude, except briefly to that of Capt. Reed's at Poverty Hill, as an illustration of the fact that rock can be here worked with profit that pays no more than $5 per ton, where the claim is managed with efficiency and a due regard to economy, for the Captain assured me that his quartz thus far had paid only from $2.50 to $5, and that it had yielded something over expenses even at these low rates. He is now below water level, and his rock is now beginning to show a decided improvement. Without underrating the quartz ledges of this place, some of which appear somewhat broken up, I must say that not the least attractive feature of this vicinity, consists in the number, extent and richness of the mining claims located and worked for the gold deposits in what appears to be

ANCIENT RIVER CHANNELS,

Many of which I examined with some care and more curiosity. They are not unlike those found in other parts of the State, and similar in every important particular, except the running water, to our mountain rivers, having the same kind of bed-rock, with a slightly different quality of gold in the crevices, overtopped with sand, gravel, sulphurets, leaves and wood; sometimes, however, petrified, and exhibiting also the usual fall of their channels, and their other principal characteristics. In some instances the beds of these underground streams appear to have been changed more than once. Some volcanic eruption has poured down its molten liquid, covering over their golden sands, gravel beds, and whatever else within the channel. The river then for a few years flows over the lava or other volcanic debris, until another alluvial deposit is made. Another layer of lava from a second eruption follows, and thus alternately till it is turned aside from its old banks to seek another channel, sometimes parallel, at others with its direction changed entirely. At White Rock, I jumped into a car, and rode down the bed of one of these subterranean streams for 1,200 feet through a tunnel, with 200 feet of gravel, volcanic cement and earth above, and among other curiosities, found another quartz lode, which had probably deposited some of its golden treasure to enrich some of the old bars now worked. In another tunnel at Smith's Flat, a boulder was seen as large as a miner's acabin, which had evidently been rolled over, having washed a hole underneath—such as may be frequently met with in many of our rivers.

The gravel from these claims is usually taken out by means of tunnels and drifts, afterwards passed through the sluices, in some instances crushed under stamps and otherwise worked like quartz. Occasionally the whole mass, where the conditions are such as to allow it, is melted or rather beaten down by the force of the hydraulic. One or two of these as illustrations and we close.

THE CLEMET D. MOORE CLAIM

Is situated on Cedar Hill in the suburbs of the town, and is owned by Messrs. Durning, Moore & Shook. It covers an area on the surface of nearly 600 feet square, was formerly worked to a certain extent by tunneling, and paid very handsomely. It has been recently opened by a cut some twenty feet lower than the old tunnel, under more favorable auspices by the parties above named, and at a cost of some $1500. They have commenced work in earnest, and as it has been estimated to pay from ten to twelve cents to the pan, we may look for a good yield. One of the parties thinks the claim can be made to pay $100 per day. This is not at all unreasonable if the ground is as rich as that of

ALDERSON & BROTHERS,

Lying across the ridge one mile south in Cold Hollow, which cleaned up for last month $9,000 above all expenses. This has been and probably is now, one of the richest hydraulic claims in the State, having about eighty feet of pay gravel. Immense sums have been taken out from time to time, but the memoranda kindly furnished on my solicitation, have been mislaid, and the amounts which were truly astounding cannot be given. There remains here extensive tracts of placers for many miles around, some perhaps as valuable as any of those mentioned, but above the level of the ditches hitherto brought in; many more, which can be made to pay good living wages, if not large profits, when water can be afforded at lower rates. A project for effecting this object planned on a grand scale, is now in contemplation, some of the preliminary steps having already been taken, I understand, but the details of which cannot now be made public, for reasons best known to the projectors, which, if carried to a successful termination, will contribute much to the wealth and prosperity of this community, and millions to the currency of the country.

With many thanks to Mr. Cullen, my accommodating host of the Cary House, and to our friend Hill and others of Placerville for many acts of courtesy, and for assistance rendered on your account, which I hope may prove mutually beneficial to us all, I remain as ever, yours hurriedly, Prospector.

El Dorado, April 1866.

The American *Journal of Mining* gives some interesting mining statistics from the census reports of 1860. Of iron, it says:

The number of States engaged in mining iron was ten (10), viz.: Pennsylvania, Michigan, New Jersey, New York, Missouri, Massachusetts, Connecticut, Maryland, New Hampshire and Ohio. Their rank, in the amount produced, is in their order named. New Hampshire and New Jersey raised mainly the magnetic ores, New York the magnetic and hematites, Connecticut hematites, Pennsylvania and Ohio raised the argillaceous ores of the coal measures, and Missouri and Michigan raised the compact red and black oxides.

One hundred and fifty-seven mining establishments were engaged in raising iron, employing three thousand one hundred and seventy-seven men, and paying them in wages nearly a million of dollars. The capital reported was $2,090,527, while the value of the products was $7,723,860.

Of copper, there are 42 mining establishments producing 499,534 tons of ore, employing a capital of $21,400,000, and giving labor to 5,039 men, and paying them $1,793,500 in wages; the sum total of product was $3,978,282. The rank of States in production was as follows: Michigan, New Mexico, Tennessee, and North Carolina.

Of coal, we raised 15,000,000 tons, giving employment to 36,469 workmen, and paying them in wages 9,650,000; the value of their labor in coal raised at the mouth of the mines was 20,000,000 against a capital of $39,428,670.

Swearing in conversation indicates a perpetual distrust of a person's own reputation; and is an acknowledgement that he thinks his bare word not worthy of credit.

From the Stock Circular of Associated Brokers of the S. F. Stock & Exchange Board.

SAN FRANCISCO, SATURDAY MORNING, May 26, 1866.

There is no apparent diminution in the amount of capital offering for loan purposes, but the demand on such securities as the bankers are willing to accept, is lighter than usual. Business requirements are moderate, and good mercantile paper is readily taken at 1 ℔ cent. ℔ month. Some important loans have been made upon first class collateral at 10 ℔ cent. ℔ annum, and even more favorable terms to the borrower are reported. This decline in rates of interest has been anticipated for some time past, and will exert a stimulating influence upon many interests in this city and throughout this interior. It is not only an evidence of the faith capitalists have in the permanency and safety of all our interests, but shows there is abundance of means at hand for the prosecution of every legitimate enterprise.

Receipts of treasure from domestic sources since the date of our last reference, amounted to $900,000; making an aggregate of $3,500,000 thus far during the current month.

There has been some improvement in the demand for Bullion this week, and a large shipment is anticipated next steamer day. Gold bars are selling at about $850, and silver has risen to 1¼@1¾ ℔ cent. premium for bars of average fineness.

Legal Tender Notes declined from 77½c to 74½c; then sold at 75c—closing at 74¾c bid; 75c asked. Large sales of 7-30's, June issue, were made at 77½@76½—closing at 77¾ bid. Latest advices from the East quote gold at 137, with a still further rise probable, in view of the financial crisis abroad and the continuation of large shipments of specie from New York.

Miscellaneous Bonds and Shares (other than mining) have been exceedingly quiet; but with the exception of City Railroad Stocks, are strongly held at higher rates. North Beach and Missionfell to $50 per share; rallied to $52, and is now held at $54. Omnibus Railroad is offered at $55. San Francisco Gas is inquired for at $110 per share; and Spring Valley Water was sold at $69.50 per shars. Very considerable private sales of City and County 7's of 1864 and 1865, have been made at 83@85c.

The Mining Share Market experienced a fresh stampede early in the week, and nearly every Stock declined materially from prices ruling previously. A slight rally took place on Wednesday, but since then this improvement has not been maintained, except in a very few instances. Little or no attention seems to be paid to the intrinsic value of some claims, and until a better feeling is inaugurated, no permanent improvement is likely to take place. It is, therefore, useless to speculate upon the causes which have led to the present demoralization of the market, or to predict what the future may evoke.

Crown Point is dull and inactive at $950—buyer 20 and 30. Some 32 feet of the shaft has been re-timbered and the new reels have been at work since the 20th inst. During the recent temporary suspension of active operations in the mine, most of the mills employed by the company were kept at work, and the receipts of bullion this month will probably equal those of April. Some 70 tons of first-class ore, worth from $400 to $450 per ton, will be treated during the current month.

Savage declined yesterday from $900 to $840. Advices continue favorable, and receipts of bullion since 1st inst., have amounted to $89,000. The average product of the mine, mainly from the 6th level, is now about 80 tons per day. The last crushing of 241 tons of ors at the Savage Mill, yielded $43.73 per ton.

Hals & Norcross has not been subjected to the decline incident to nearly all other Stocks, being steadily maintained within a rangs of $955@970, closing at $960. This mine is producing, daily, about 70 tons of ore, and in raising up, its quality is said to show some improvement. The stopes from the lower level have been extended to the 14th floor—a hight of about 80 feet.

Gould & Curry is in less favor, declining from $850 to $730; then offered at $775, and closing at $725 bid. The upper works still disclose a very considerable body of good ore, and the yield of bullion, thus far during the current month, is fully up to the usual average. The water in the different drifts, from the lower stations, has been subdued, and further explorations can now be made without difficulty. The company have a surplus at their credit of about $84,000.

Yellow Jacket steadily declined from $730 to $600; rallied to $645; dropped to $630, and sold, yesterday, at $610@595. The yield of bullion in April amounted to $84,827.28; other receipts were $5,-892.51, and the balance at the credit of the company on the 1st of that month was $11,237.66; making an aggregate of $101,957.45. The disbursements for current expenses, during the same period, amounted to $96,619.43, leaving a balance on hand, 30th inst., of $5,338.02. The company's mills crushed in April 2,289 tons of ore, yielding $51,103.77—an average of $22.31 ℔ ton; and 150 tons third-class, averaging $15 ℔ ton. Outside mills reduced 1,718 tons of second-class, producing $31,473.51, or an average of $18.31 ℔ ton. The cost of working 2,113 tons of ors at the Yellow Jacket Mill was $11.42¼ ℔ ton. During the first two weeks of May, 1,940 tons of ore were extracted from the mine and the yield of bullion amounted to $33,929.

Ophir has been depressed, and some 350 feet were dealt in, declining from $425 to $350, rallying to $380, receding to $365, and selling yesterday at $350@377½. Latest telegraphic advices represent the lower level south, as rather more favorable, and other portions still unpromising. Receipts of bullion thus far during the current month have been as follows: From the Woodworth Mill, $31,956; Reduction Works, $30,000, and from Land's Mill, $5,200; in all, $67,156.

Chollar-Potosi has been active at lower rates, and nearly 500 feet were sold, receding from $330 to $295, rallying to $321, buyer 30, dropping to $295, and then selling at $293@296. The different stations are said to be looking well, and from the Belvidere ground it is thought that a "large amount of good ore can now be taken." In drifting from new shaft clay is still met with, and quartz may soon be reached. During the week ending 19th inst., 1,300 tons of ore were sent to Custom Mills.

Belcher fell from $270 to $185, rose to $215, receded to $195, and sold yesterday at $175@192½. Alpha met with trifling sales at $190—assessment not delinquent. Empire Mill & Mining is well held at the close at about $165 ℔ share.

Imperial declined from $128 to $112½, rose to $130, receded to $124, and sold yesterday at $124@123. The drift from the old shaft toward the 7th level is in some 180 feet. Receipts of bullion for the first half of this month, were $28,878.41.

Overman fell from $66 to $49, rallied to $53, receded to $47½, and sold yesterday at $40@30. Bullion declined from $77½ to $53, rallied to $75—assessment delinquent—and sold at the close at $76. Confidence has been sold at $32@30, and Exchequer at $8¼@7½.

The total recorded sales of Stocks, Legal Tender Notes and Bonds, since Saturday last, amounted to $843,409.

CALIFORNIA BUILDING AND LOAN SOCIETY

Removal Notice.

THE DIRECTORS OF THE CALIFORNIA BUILDING AND LOAN SOCIETY, announce to the public the removal of their business to their

NEW BANKING HOUSE,

California Street, one Door from Sansome.

LOANS.

The Directors propose an extension of their Banking accommodation to the assistance of—

First—The Purchase of Real Estate.
Second—The Erection of Houses.
Third—The Erection of Manufactories.
Fourth—The Building of Sea and River Vessels of all sizes.
Fifth—Mercantile Cash Credits on the Scottish principle, for such time as may be agreed upon.

Under the above general heads, loans will be made for terms of years to correspond with the requirements of parties upon the security of REAL ESTATE, BUILDINGS, SHIPS and MERCHANDISE.

MONTHLY DEPOSITS.

ONE PER CENT. PER MONTH will be allowed on all deposits made at one month's notice of withdrawal.

CURRENT ACCOUNTS.

HALF PER CENT PER MONTH will be allowed on the daily balances to credit of Current Banking Accounts—the same to be ascertained and credited monthly.

REMITTANCES FROM THE COUNTRY

PROMPTLY ACKNOWLEDGED.

INTEREST on all sums commences from the day of deposit.

DEPOSITS of any amount received, from FIVE DOLLARS upwards.

OFFICE HOURS—9 1-2 A.M. to 3 1-2 P M. daily.
SATURDAY EVENINGS from 6 1-2 to 9 o'clock.

THOMAS MOONEY, President.

WATCH REPAIRING AT NEW YORK PRICES.

NEW YORK PRICES.

Postage.—The postage on the MINING AND SCIENTIFIC PRESS to any portion of the United States is twenty cents per annum, or five cents per quarter, payable in advance at the Post Office delivering the paper. Postage free in the city and county. Foreign postage (with few exceptions) two cents per copy, prepaid. To Bremen and the German States (marked via Bremen and Hamburg line), three cents per copy, prepaid. Single copies to any address in the United States, two cents.

Pacific Mail Steamship Co's

THROUGH LINE TO NEW YORK,

Carrying the United States Mail.

LEAVE FOLSOM STREET WHARF, AT 11 o'clock A. M. of the following dates, for PANAMA, connecting via Panama Railroad, with one of the Company's splendid steamers from ASPINWALL for NEW YORK.

On the **10th, 18th and 30th** of each month that has **30** days.

On the **10th, 19th** and **30th** of each month that has **31** days.

When the 10th, 19th and 30th fall on Sunday, they will leave on Saturday preceding; when the 18th falls on Sunday, they will leave on Monday following.

Steamer leaving San Francisco on the 10th touches at Mazatlan. All touch at Acapulco.

Departures of 18th or 19th connect with French Trans-Atlantic Co.'s steamer for St. Nazaire, and English steamer for South America.

Departure of 30th connects with English steamer for Southampton, and P. R. R. Co.'s steamer for Central America.

Departure of the 30th connects with English steamer for Tumaco, the port of the new mines.

The following Steamships will be dispatched on dates as given below:

May 30th—SACRAMENTO. .....Capt. J. M. Cavarly,
Connecting with ARIZONA, Capt. Maury.

Cabin passengers berthed through. Baggage checked through—150 pounds allowed each adult.

An experienced Surgeon on board. Medicine and attendance free.

These steamers will positively sail at 11 o'clock. Passengers are requested to have their baggage on board before 10 o'clock.

For Merchandise and Freight apply to Messrs. WELLS, FARGO & CO.

For passage and all other information, apply at the Pacific Mail Steamship Co's office, corner of Sacramento and Leidesdorff streets.

OLIVER ELDRIDGE, Agent.

GEORGE E. BROWN,

(Late Assistant Examiner in the U. S. Patent Office,)

HAVING RESIONED THAT POSITION AFTER A TENure of office of eighteen months, offers his services to

INVENTORS AND THEIR ASSIGNEES,

—AS A—

Patent Solicitor,

He will make Preliminary Examinations in the Patent Office, with a view to ascertain the Patentability of any invention that may be submitted to him for that purpose; will prepare the necessary papers for those who wish to make Applications for

Patents for their Inventions,

—OR FOR—

EXTENSIONS OR REISSUES OF PATENTS

Already granted; will act as an Attorney in prosecuting Applications at the Patent Office, and in managing them to a final issue; will draw up Assignments; will examine into the condition of Rejected Applications when desired to do so, and undertake the prosecution of such as may be considered patentable, and do whatever else is usually done by Patent Solicitors.

Address, P. O. Box **257**, Washington, D.C. 7v12-3m

It is filled with reliable, useful and interesting matter, and to our miners who wish to understand the theoretical, as well as the practical part of their business, the MINING PRESS will be found an invaluable aid.—[Nye County News

VOLUME TWELFTH.—The MINING AND SCIENTIFIC PRESS, with its last issue, commenced its twelfth volume. Since Dewey & Co. have "held the ribbons" its gait has been rapid toward a perfect journal. Its appearance evidences its prosperity, but doubtless, like some of the rest of us, it can stand increased encouragement. Let such be given, and, our word for it, volume thirteen will acknowledge receipt.—[Golden Era.

Mining Summary.

CALIFORNIA.

Alpine County—

The Monitor *Gazette* of 19th inst., has the following items:

Ths Active S. M & T. Co., will soon commence operations. The Morning Star company are drifting on tbeir ledge, intending to open another chimney nhout 250 feet from the one first struck. They have less than 100 feet to make now to reach that chimney, and ars finding good ore all the way.

Work on ths American is prosecuted night and day. A flume bas been built to carry the creek water past the shaft, and the pumps now keep all clear.

The workmen on ths Eastern Slope tunnel, struck a body of water which caused a cave, and they have tbis week been busy timbering up preparatory to cutting tbrough into tbe ledgs.

Thc hig cave in the casing of the Winchester ledge bas been cleared out.

The Mullan G. & S. M. Co., broke ground on Thursday for a shaft to be sunk to a deptb of one hundred feet below the level of the tunnel at the point where tbe ledgs was cut. At tbis point, only thirty feet below the surface, ore is found of good quality.

From ths Silver Mountain *Bulletin* of May 12th, ws condense the following:

Work is progressing rapidly in tbe tunnel of the California & Illinois company, in Raymond district. Ventilating pipes have been introduced.

Doct. Pilkington, as agent for an Eastern company, is about commencing a double track tunnel, for the purpose of cutting the Desperado and Atlantic ledges.

The ledgs in the Pennsylvania company's claim is now ten feet in thickness, and has a splendid gouge—indicating a perfect ledge. They are now running in the easing on the east side, and parallel with the ledge, and will cut it after running some thirty-five feet further.

Tbs Washington company's mine is still closed to tbe public. The editor of the *Bulletin* says, however, "we are informed that a short time only will elapse before tbe world will know all."

One thousand feet in the Honsst John lode, situated in Scandinavian Cañon, Silvsr Mountain district, was sold a few days ago to a company of New York capitalists. Tbe claim is named the Atlantic. Work has already been commenced. Several well known ledges will be crossed by the projected tunnel of 2,500 feet. Specimens from each of these will he sent to New York. The editor augurs the commencement of a new era in mining operations in Silver Mountain district.

Amador County—

Tbe *Dispatch* of 19th inst., says: Coney & Co. on last Friday evening started their mill with sixteen stamps with four of Prater's concentrators. Ths parties reported to have purchased this company's interest, several weeks ago, failed to comply with the terms of their agreement.

From the *Ledger* we learn that the Oak Hill copper mining company—first sonth extension of the Newton—have resumed work with good prospects.

The rock taken from the Kennedy lode, near town, is now heing crushed at the Coney mill, and pays handsomely.

The same paper says: The auriferous talc mines of Amador are likely to prove a valuable investment. The north extensions of the original loeations, the Mount Echo and Mohawk, bave been sunk to a depth of twenty-two lset and show a lode of pay rock of an average width of ten feet. Tbe last six or eight lset sbowing a decided improvement in the quality of the ore, nnd much free gold is visible—not unfrequently being found in pieces of from one to several dollars in value.

Butte County—

It is said tbat a San Francisco company is negotiating with parties owning extensive claims on the Smartsville road, nearly opposite the Empire Ranch. To obtain a fall they propose to construct a tunnel seventeen hundred feet in length, at an estimated cost of one hundred thousand dollars; and before the claim can he properly opened, an expenditure of at least $700,000 will be necessary. Tbe parties now owning ask $550,000.

Calaveras County—

The Copperopolis *Courier* of 12th inst., says: The quartz mill of Mr McGlynn, near San Andreas, is completed, and is now engaged on cement ground and tailings, which pay about ten dollars to the ton. William Irvine is about to erect a mill on bis claim at El Dorado. Tbe Kentuck company have resumed operations in their new shaft, with excellsnt prospects. At a depth of only twenty feet the lead is three feet wide and appsars to be rapidly consolidating.

Colusa County—

The *Sun* says: "Mr. Hardenhorg sent out this week a steam engine, to he used in horing for oil on bis claim on Bear creek. He has heen boring for several montbs by hand and the indications are eonsidered most flattering."

Fresno County—

A diseovery of a rich quartz vein was lntely made on the head of Coarse Gold gulch, about six miles southeast of McKeamer's store, in Fresno cnunty, by Colonel John Moss and William Sherer, of San Francisco. Maehinery is to be put up at once.

Lake County—

It is said that the company owning tbe borax mines in Lake county, have made extensive preparations for taking out large quantities of borax this season. This mineral is dug in erystalized masses from the bottom of Clear Lake, wbere it is deposited by springs. A large movnble cofler dam is sunk in eertain parts of the Lake, whieh, on beiug pumped dry, allows the workmen to seareh the muddy bottom for borax crystals.—*Grass Valley Union.*

Monterey County—

Tbe *Gazette* says that einnabar from n new mine recently discovered in the San Bonito mining district, on what is called tbe Clear Creek ledge, located about sixty-five miles from San Juan, is as rieh as any that was ever excavated at the New Almaden mines in Santa Clara county. The ledge is ahout eight feet wide. Operations will hs immediately put on foot for the erectiou of suitable smelting works, etc.

Nevada County—

The *Gazette* says: A crushing of ten tons of rock from the Mammoth ledge, situated a short distance abovs tbe Oriental mill, was eleaned up last Friday, and yielded within a fraction of ten dollars a ton. The free gold ouly was saved. The rock can be taken out, hauled and crushed in an ordinary mill, at an expense not excesding five dollars a ton.

We visited ths Camanche mine, yesterday, and were favorahly impressed, not only with tbe locntion of ths ledge but the appearance of the rock, and the prospeet ohtained therefrom. Tbe two ledges under that nams are between the Sneath & Clay ledge and the Mohawk, aud parallel with tbem.

The *Transcript* says:

The mills in Little York township are driving ahead night and day. The cement that is taken out is exceedingly rich. One of the companies clenned up last week $6,380; another $2.000; another $2,300, and others less, witb a glorious prospect ahead.

Mallory & Co., at You Bet, struck rich cement in their claims—richer than any found yet on the Blue Lead. It extends the entire length nnd depth of the lead as far as could be examined. Thousands of dollars of gold can be seen.

The Grass Valley *Union* bas the following items:

It is rumored that the celebrated Star Spangled Banner mine, situated at Nevada, has been sold to San Francisco parties for $100,000. This mine is one of the recent discoveries and is among the most promising in the county. We yesterday saw some very fine looking rock, taken from the Utah mine. It was hrilliant with particles of fine gold and sulphurets. The ledge shows a thickness of between eight and twelve inches. It is one of the most promising mines in this section.

A rich deposit of gold was struck on Saturday last in the Yellow Diamond ledge. This lead, says the *Transcript*, is located about three-quarters of a mile heyond Chapman's ranch, on Rock ravine, near Rush creek. It was first located in 1858, and a pocket was found from which $6,000 was takeu. A Nevadan invested some $400 in a lead a few weeks ago, and paid as much more for assessments. On Saturday last he was offered the sum of $13,000 for his interest. He refused to sell, helieving if he held on awhils he could get $20,000 or $30,000. The Eureka Company at Grass Valley, clenned up 2,300 ounces of gold, worth about $36,800. This was after a run of two weeks. The mine was recently sold for $400,000. The mill will be stopped for a time for the introduction of new and improved machinery.

The plncer claims in Nevada county are not worked out yet. The Manzanita Hill claim turned ont $1,200 last week, and the Lost Hill claim yielded at the first clean up $7,000. Many claims at Gold Flat are paying rich.

Excelsior.—The Dutch Flat *Enquirer* of May 17th, closes an article on this district thus:

No douht seems now to exist in tbe minds of any, as to thc extent, stability, and fabulous richness of the mines in this section. Noue of the quartz mills are running ut present, but will start up ahout the first of next month.

The Marysville *Appeal* of the 19th, says:

The rush of gold-hunters will hc unparalleled in this county. The city can bo built in a day, but the mines eannot be developed in a fourth of a century. Tbere will then he a eity of eonsumers, and how long will capital and enterprise withstand the pressure? Thers will be a permanent and flourishing city at ths Summit, but not tbis year. Ninety-nine of the one hundred of people wbo go thers will come away disappointed.

A correspondent of the *Stars and Stripes* says "ths first of June will be early enough to go." Tbere was four feet of snow at Meadow Laks on May 11tb. A Mr. Harrison, of San Franciseo, was daily besieged at bis hotel witb applications for the erection upon this or tbat mine, of his 20-stamp mill, now on tbe way.

Placer County—

The *Herald* bas theas items:

The ledge of the Good Friday Company, owned by Mr. Wahlgren and his partner, is only about two inches thick, hut very rich. One day last week, they took out $1,400 in one hour's labor. The Wells' quartz claim, four miles north of Auburn, has recently turned out some splendid rock. Although not rich in speeimens, gold bearing sulphursts and fine gold ore liberally disseminated through it. We are pleased to learn that there is a prospect of a mill going up on this ledge during the summer.

One ton of rock from the Taylor lead has been sent to San Francisco for trial. The shaft is now down between thirty and forty feet.

A sluice-robbing Indian was killed a few days ago, at Gold Run, by n torpedo, placed to prevent such depredations. Due notice had been published in the *Enquirer* that ths miners were resorting to this expedient. This had been effective as regards "white" robbsrs.

Sacramento County—

The *Union* has seen some fine specimens of ore from the Jersey Gold mine at White Rock. A shaft has been put into the mine to the depth of two hundred feet, and the ore taken from it has averaged $50 to thc ton. It is the intention of the owners to erect a mill at once.

Santa Clara County—

New Almaden.—There are now about thirteen hundred men engaged in mining, reducing ore, sorting, and other work, at the quicksilver mines. Tbe company have recently erected new and very extensive reduction works on an approved plan.

Sierra County—

A correspondent of the *Union*, writing from Downieville May 13th, says:

Numerous gold bearing ledges have heen taken up and recorded, and some prospected proved good. A New York capitalist has invested in one on Mount Pindus. * * A ledge of supposed vast richness, containing gold, silver and copper, has been located half way on the line between here and Meadow Lake. It assays, in gold and silver, $48 to the ton of 2,000 pounds, and the copper is a big item. The gold is contained in a yellow sulphuret of copper.

The miners in Star Valley District had a meeting on May 10th, for the purpose of altering the By-Laws.

Tulare County—

Tbe *Times* of May 18th, says:

We receive from all parts of the neighboriug mining regions the most encouraging accounts. Nearly all the mills at Clear Creek ars at work witb profitahle results, and tbe mines continue to improve as they are developed. Bigler & Co.'s mill is nearly completed. The Joe Walker lead is proving extremely rich. The shaft is down 64 feet, and the rock improves continually. The new district known as the Piute is attracting much attention. A sale of one lead, unopened, is reported for $50,000. Tbe old Mammotb lead, near Kernville, famous some years ago for its extent and richness, bas been purchased by a San Francisco company, who are prosecuting the work with energy and system. Kelso cañon is heginning to attract capital and work. One mill is already up, and another under way, if not already laid down. The Long Tom is reported to exceed anything yet discovered, as to the size of the lead and the richness of the rock. The vein is six feet thick, and permeated with free gold, plain to the naked eye, throughout.

The Inyo correspondent of the Visalia *Delta* says:

Prospects brigbten daily, and our miners and mill owners are in high spirits. Captain Paul's mill will run next week. The New York Silver Lead company are getting out wonderfully rich rock. Mr. Dorr's New York company's mill has just passed here from Los Angeles, and another large mill is on the way for the same locality. The Oro Fino company will soon have a fine 20-stamp mill in operation. The Fish Spring district is coming ont, some of their rock recently worked giving $173 per ton.

Tuolumne County—

A correspondent of the *Courier*, writing from Uniontown, Sugar Pine District, May 15tb, says that Comstock's mill will commence work again in a day or two. The Waterhouse placer elaim cleaned up 29 ounces last week. The Excelsior commenced work yesterday; tbey are down 380 feet, and will go 200 deeper. The last clean-up of the Mount Vernon sbowed an average of over $200 to the ton. The sbaft is 200 feet eeep. Thirty men are at work.

Tbe town of Sonorn is "looking up."

NEVADA.

Dayton—

The Lyon county *Sentinel* of 19th instant says—

Tbe prospects for the ensuing summer in Dayton ars very good. Our mills are all in operation, and every ons desiring it ean procure remunerative employment. Mr. Henley was about to visit the East for the purpose of disposing of his mineralogical eabinet, spoken of by tbe *Sentinel* as being the most valuable and complete in the State, containing over fifteen thousand specimens.

Reese River—

A correspondent of ths *Reveille*, writing from a new district in Nye County, called Silver Bend, says:

Timber is very nbundant, but water rather scarce. The mines are very nccessible; teams can drive to the ore. The veins, for richness and size surpass anything yet disecvered. I have had nn assay from one of them whieh yielded $1,100 and over. I havo had rock worked from another which yielded by mill working $2,600.

The same paper of 16th inst., says:

We learn that tbe Providential vein is improving in appearance and character as depth is attained. An assay of a portion of its basest ore, just made by J. R. Murphy, of the National Bank assay offics, yielded $49 of silver.

The fins new 20-stamp mill of the Manhattan Company was set in motion yesterday. It is not yet completed, but lacks its improved furnacss and new amalgumating room, which are in course of construetion.

We learn that the bonds obtained hy means of the mortgage on the property of the Keystone S. M. Co., had been convcrted into funds to meet all liahilities here, as well as to prosecute work on tbe mines belonging to the company. Ws nre informed that richer ore than ever before found in the vein is being exhibited in the Metacom, and the splendid develoments in the Yankee Blade last week, all combine to insure a prosperous future for tbat section.

Snmc, of 19th, speaks of a communication received from ths Superintendent of the Sterling Company's Mill, at Kingston, and says:

The writer gives the result of the working nt that mill of eight tons of ore from the Brown ledge in that district, as follows: Silver, $334.76; gold, $57.64; total, $392.40; or an average yield in gold and silver per ton of the value of $49.04. * * And he concludes by stating on the authority of one of tbe owners of the Brown ledge, that tbere are over 300 tons of the same quality of orc on hand, and an extensive quantity in sight.

From the Nye County *News*, of the 12th inst., ws condense the following:

Assays sbown to us from the croppings of three ledges in Crescent City Canyon, are, respsctively, per ton: Flershiem, $178.47; Belvidcre, $154.79; Galena, $18.95. These ledges average over five feet in widtb, and were located by M. T. Joice, for himself, Hyman, and others.

The Mt. Vernon Co., Mammoth district, are sinking a shaft seven by nine feet in the clear. Some four hundred odd feet east of the shaft, a tunnel is bsing run, which will intersect it at a great depth. The tunnel is already in over one hundred feet, and it is prohnble that it will be used chiefly for drainage. Gen. Rosecrans is the general agent for tbe Co, and is expected to arrive in a few days. The Succor mill is running steadily, and gives good satisfaction.

Correspondence of same paper, from Weston, in Mammoth district, says of the Branch Mint lode:

It is a hlind lode, two feet wide, with eight or ten inches of as rich ore as any yet found in Mammoth. It was acoidentally discovered in working the Erie, a few days since, and has heen opened to a depth of only three feet hy eight feet in length, from which small space several tons of as rich looking ore as Nevada can produce, has been extracted.

Of tbc Erie, in the same series, (Ontario):

It is of great power, heing over six feet from wall to wall, with three and a half feet of very rich ore.

Correspondence of same, from Washington, Nye county, May 10th, says:

Business is beginning to look up with us. I

am creditably informed that a large force of workmen will soon be put on the New Hope mine.

Active preparations will soon be commenced on the series of ledges located for the Atlantic Co., of which Gen. Rosecrans is the managing head.

A 20 stamp mill is to be erected at Washington.

Esmeralda—

The *Union* of the 19th inst., has the following: The news from Bodie is cheering. The last clean-up of the Empire company was $9,000, and from eighty-five tons of Homestake ore, the yield was $8,000. The Osceola, one of the ledges of the Empire company, is improving. The ledge is five feet thick at a depth of two hundred feet from the surface, and the ore is of a very fine quality. The Golden Age & Empire company have let a contract to sink their shaft one hundred feet, provided the contractors do not sooner come upon water in sufficient quantities to stop them from working. As soon as the water begins to interfere with the work, machinery will be placed upon the mine to pump out the water and hoist the rock. Mr. Taylor, the Superintendent of the Philadelphia company, has let a contract to sink the shaft lately started at the mouth of the Discovery tunnel fifty feet deeper. The machinery for the company is expected to arrive soon from San Francisco.

A Columbus correspondent of the *Enterprise* of May 2d, says:

The mines extend over an area of about twelve miles in length by eight or ten in width. The pay ledges, though not extremely large, are well defined. The Baluarta ledge has been opened by sinking an incline on the ledge some ten or twelve feet, which at that depth shows a well defined lode of pay ore, about four feet in thickness. The Plata Verde Company have run a cut to their ledge, which they have just reached, and found rich ore.

The Servia has an incline down 30 feet.

Humboldt—

The *Register* of 12th inst., says:

Bill Tally and Garrett Tormay have been drifting in a ledge in old Trinity district. In a little less than two weeks they got out 500 pounds of ore which assays $4,000 to the ton.

ARIZONA.

It is said that forty men are already enrolled towards the party of one hundred which is being raised in San Francisco for the expedition to the White Mountains, in the interior of Arizona. The route proposed is that via Los Angeles, or San Diego, to Fort Yuma; thence via the Pimo Villages to destination. The Austin *Reville* says that a company of thirty men from the Reese River region will join the expedition at Collville or Prescott.

IDAHO.

The Idaho City correspondent of the Oakland *News*, under date of April 22d, says:

The Spring, though cold and stormy, is a month earlier for mining purposes than last year. Mining operations are now in full blast, and are being vigorously pushed in all parts of the basin. The hillsides and bars bristle with flumes pouring immense quantities of tailings into the creeks which have been worked out. The work goes on night and day, and the thousands of camp-fires on hills and bars at night present a magnificent appearance. We hear of large returns from a number of claims, among them Mason and Hemphill's, which cleaned out $4,000 in two weeks' run. Others have gone beyond that figure, while I hear of a number which have failed and run behind large amounts. Mining is a lottery in which all do not win prizes. Wages this Spring is $5 and $6 per day, and board $12 per week. Good hands are rather scarce, but I should judge that there is plenty of men in the basin to do all the work. Quartz interests here in the basin are completely dead, having received a severe check by the failure of two of the most promising ledges—the Astor and Chickahominy. They were purchased by the New York company over a year ago, and after erecting five mills, and other works, at a heavy outlay of capital, now find they have nothing. Idaho City does not present as lively and bustling an appearance as it formerly has. The large crowds that could be seen on the street corners at most any time, have mostly disappeared, and empty houses and stores are plenty, with notices posted on them for sale. But those who are stopping here are doing full as well as formerly. The Blackfoot excitement, and the unfavorable season last year for working men has produced this result."

Owyhee—

It is said that a sale was recently made of the Oro Fino mine, and the Morning Star mill and mine, in Idaho, for the sum of $1,600,000. The purchase was made by a New York and English company of capitalists.

The Red Bluff *Independent* of May 16th, says: "For the past two or three days great preparations have been going on among the teamsters starting for Owyhee. Sneath & Boarman loaded up the mill machinery yesterday for the Flint district, Owyhee. The merchandise will be loaded this week. There are twelve ox-teams and fifteen horse and mule teams about starting."

The steamer for Snake river has been launched. She is 138 feet long, 26 feet beam, 243-horse power and draws 16 inches water.

The citizens of Owyhee offer, according to the Walla Walla *Statesman* the following prices for Indian scalps: For bucks, $100; squaws, $50; pappooses, $25. Seventy persons are already enrolled to engage in this hunt.

MONTANA.

A letter to the *Post* from Prickley Pear City, April 21st, says:

Operations have again commenced on Prickly Pear creek. Two companies are engaged in sinking shafts. Messrs. Nicholson & Co. are at work on the old shaft of Seahorn & Co., and are putting in an eight-foot overshot wheel. Wm. Alexander & Co. are to work one fourth of a mile below, and are bringing water from McClellan gulch.

New lodes are being found here every day. The Gifford lode, discovered by Messrs. Gifford and Robinson, of Helena, is attracting a good deal of attention. It has a shaft sunk on it about twenty five feet in depth, and shows a crevice of seven feet width. It is a silver lode and native silver can be seen in nearly all of it. It is situated about one and a half miles west from this place.

The Saggitarius, which is thought to be this same lode, is also rich with silver. By an assay of Professor Eaton, who holds a half interest, it shows $800 per ton, at a depth of eighteen feet.

The placer mines of Indian creek, on the Missouri, about twenty miles east of this place, are said by those just in from there, to be good. Big Indian, Sky-High, and others about the head of Holmes' and Dry gulch, are also yielding well.

The large steam quartz mill, which has laid in Boulder valley all winter, just passed through here, en route to the famous Brown lode, near Nelson gulch.

The Helena correspondent of the *Post*, May 2d, says:

News has been received, during the past week, of the discovery of very good diggings just beyond Medicine Rock, on the Little Prickly Pear. It is but a few feet to the bedrock; prospects vary from ten cents to three dollars to the pan, and a nugget weighing nearly forty dollars has been found.

The Bannock correspondent of the same paper, April 30th, says:

Messrs. Smith and Graeter are making extensive preparations to mine on a large scale. They have two hydraulic powers to run, besides turning Grasshopper on Jemmy's Bar. They are now employing a good many hands in repairing their ditch, etc.

Last week, in the lower part of the canyon, known as Yank William's diggings, Messrs. Mitchel and Sulley sank a prospect hole in the gulch, five feet square, and took out $25 in coarse gold; but could not clean the bed-rock on account of the water.

Jacob Rower, of Silver Bar Gulch, took from his claim, on the 30th of April, a nugget of nearly pure gold, weighing $105.

A brick weighing $2,100, was the result of a five days' run of a 6-stamp mill on the Kearsarge lode at Summit.

The Helena *Radiator*, of May, 5th, has the following items from Elk Creek:

J. W. Keenan, with four men, is cleaning up from $130 to $250 per day, to the sluice, in the main creek; Johns, with same force, from one to two hundred. The claim on Bilk Gulch, in which Charley Marden is interested, yielded $680, with one rocker, one day last week.

More gold has been exhibited during the week than is usual in this town; many coarse pieces have been picked up. Wheelock & McBride picked up $100, or over, in lumps in the ground sluice. Charley Marden's claim has paid between six and seven thousand dollars within two weeks.

The same paper says:

Indian creek is beginning to pan pretty well. From recent accounts from there we learn that much gold is being taken out now, out of the upper part of the creek, where water is in greatest abundance.

A Helena letter to the Reese River *Reveille*, dated April 28th, says:

There is considerable prejudice and strife existing between the 'pilgrims' and 'othersiders,' as they call them here. The pilgrims seem to think that they own the country because they came first, and judging from some of their mining regulations, one may reasonably presume they do own it. There is an instance where only thirty men claim an entire gulch, fully thirteen miles in length, which is something less than half a mile apiece. The discoverer of gulch diggings is entitled to four hundred feet from summit to summit in each district, and they make as many districts as they choose in each gulch. We will endeavor to remedy this, however, when we become numerically stronger.

BRITISH COLUMBIA.

The steamer '49 had made one trip from Collvillo to the foot of Death Rapids, fifteen miles from the mines on French Creek. She carried seventy-three passengers. She was nine days on her way up, but returned to Collville, 250 miles in two days.

COLORADO.

We gather the following items from the *Journal:*

Beverly & Son, of Nevada, are re-building the inside of the old Beverly mill. On the Kansas, Mr. Waterman has struck a soft, rich gouge He is putting in ball-grinders and shaking tables. Mr. Garrison goes East in a few days, and expects to take ten pounds of gold. Mr. Frink started twenty-five stamps in his new mill last Monday. Mr. Young had to take down the engine of the Stoner mill for some reason, and it is not now running. He tried his amalgamator a very little, before he stopped the mill. He was satisfied with its performance. J. Alden Smith has a C. & T. desulphurizer pretty nearly ready to run, over on Clear Creek. Mr. Cushman is going ahead with his for the Montezuma Company. Mr. Adams is still running his, and so is the Cook Company at the Excelsior mill. Mr. Adams says he can get more gold from his ore before it goes through the cylinders than after. He is making preparations to cut up the cylinders for some or any other use, and put up a Keith furnace. The works of the Sierra Madre company are rapidly approaching completion. Mr. Perrine believes he has at last struck the Washcash lode, for which he has been looking since Colfax was here last summer. It is said to resemble the Pewabic and to be very rich. We are told that $25 weight of gold was washed from two pans of dirt, and that wall-rocks have not yet been struck. The third section of twenty stamps in the Black Hawk Company's new mill has started, and now may be seen sixty 880-pound stamps pounding away, night and day, under one roof. The mill crushes six cords of ore per day. The *Journal* advises its friends to abandon the C. & T. (Crosby & Thompson) desulphurizer, and says Mr. Waterman has one for sale cheap. Three cords of quartz were said to yield Col. Grafflin 102 ounces of gold.

The Denver *News* exposes the "Golconda Gulch Association," a swindle lately gotten up in New York, purporting to be located in Colorado Territory, and gives extracts from its magnificent prospectus. The capital stock is named at one million dollars.

City College Laboratories,

Southeast Cor. Stockton and Geary sts.

Practical and Analytical Chemistry and Metallurgy.

THOMAS PRICE,

Professor of Chemistry,

(Formerly of the Normal College, Swansea.)

WILL GIVE PRACTICAL INSTRUCTIONS IN QUALITative and Quantitative Analysis and Assaying. The course qualifies students for the application of Chemistry to METALLURGY, MANUFACTURING ARTS, and MINING PURPOSES

PHARMACEUTICAL and TECHNICAL CHEMISTRY, such as is required by Medical and Pharmaceutical Students, will be taught to such students as may require it.

Course of General Chemistry.

Evening Lectures will be delivered every Tuesday, at half past seven o'clock, P. M., in the Philosophical Hall of the College, without extra charge to the students in the Institution.

On and after the 14th of February, the Laboratories will be open every day, except Sundays, from 8 A. M. to 5 P. M. For further particulars, address

REV. P. V. VEEDER,
Principal of the City College.
6v12tf Or at 406 California Street.

SANTA CLARA COLLEGE, S. J.,

SANTA CLARA, CAL.

Conducted by the Fathers of the Society of Jesus.

The FIFTEENTH ANNUAL SESSION of this College will commence on

Monday, August 28th, 1865.

TERMS—Tuition in the Classical and Scientific Department; Boarding and Lodging; Washing and Mending of articles washed; School Stationery; Medical Attendance and Medicine; fuel, light, baths, etc., per session of ten months..... $350

For further information and catalogues, apply to the President of the College, or to Rev. A. Maraschi, St. Ignatius College, Market street, San Francisco.
3v11 REV. A. MASNATA, S. J., President.

SACRAMENTO SEMINARY.

BOARDING SCHOOL

FOR YOUNG LADIES,

Tenth Street, between F and G.

SACRAMENTO, CAL.

Session commenced January 8, 1866.

It is Impossible for editors to know ALL the merits and demerits of their correspondence, consequently the reader must not receive the opinions of our contributors as our own. Intelligent discussion is invited upon all sides and the evidence of any error which may appear will be received in friendship and treated with respect.

American and Foreign Patents.—Letters Patent for Inventors can be secured in the United States and foreign countries through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past two years.

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the MINING AND SCIENTIFIC PRESS, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

Payment in Advance.—This paper will not be sent to subscribers beyond the term paid for. The publishers well know that a good journal cannot be sustained on the credit system.

Mr. Wm. R. Bradshaw, is our Special Correspondent and Traveling Agent. All favors or assistance rendered him in his progress through the country in behalf of our journal, will be duly acknowledged.

SAN FRANCISCO, Jan 1st, 1866.

Mr. A. C. Knox, is our fully authorized Traveling Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office.

SAN FRANCISCO, Jan 11th, 1866.

Mr. I. N. Hudson, is authorized to solicit subscriptions, advertising, etc., for the MINING AND SCIENTIFIC PRESS, in San Francisco, and to receipt for the same.

Mr. S. D. Woods, will correspond and act as Agent of the MINING AND SCIENTIFIC PRESS in the interior.

San Francisco:

Saturday Morning, May 26, 1866.

ORE SMELTING IN COLORADO.—Three gentlemen of Nevada City, Colorado, Messrs. John R. Beverly, J. J. Cranmer, and Albert Gilbert, have been making some experiments in the smelting of ores, and the results seem to be entirely satisfactory; in communicating the account of their experiments to the Colorado *Journal*, they say: "Several weeks ago the undersigned associated themselves together for the purpose of practically testing (for themselves and others of the public who are not fully informed on the subject), the economy of treating Colorado ores for the precious metals by the process of smelting. Accordingly a smelting furnace of the 'Kustel' pattern—same as was used in early times in San Francisco for reducing the Washoe silver ores—has been erected in this place. This furnace, which is capable of working about four tons of ore in twenty-four hours, is made of the common brick manufactured at Central City, and saturated with a chemical solution. The hearth, which is 60 inches by 22, and the crucible 36 inches in diameter, are composed of clay and an admixture of fire-proof stone, which is found in the immediate vicinity in the greatest abundance. The total cost of the furnace is about $2,500.

NEW ARTIFICIAL LEG.—Mr. S. D. Smith, of Marysville, has invented a new artificial leg. It is entirely original, as the inventor has never seen any patents or models of the kind; but has constructed this, his first attempt, for his own use. The late Surgeon Cooper pronounced the first one made the finest he had ever seen, and the present mode is much improved. It is constructed of willow, firmly bound with steel, and combines in a remarkable degree, lightness and strength. The boot is composed of three parts, connected by delicate springs, giving it the movement of the true foot. The ankle joint, connected with the leg, is arranged with springs that give elasticity and ease to the motion of the whole leg. The inventor intends to apply for a patent.

BRASS FOUNDRY.—A day or two ago we dropped into the brass foundry of Gallagher & Weed, on First street, next to the office of the Pacific Foundry, and found a large force at work turning out the different articles in their line, for which there is now an increasing demand.

IMPROVED COMBINATION BANK LOCK.

Mr. William C. Bussey, of Jackson, has recently obtained a patent for an improved burglar and powder-proof combination bank lock, designed for safes, vaults, etc., which appears to be the most perfect thing of the kind yet devised. It presents no possible opportunity for the burglar or lock-picker to exercise his ingenuity in opening it. There is no keyhole in the opening to the lock. Upon the outside of the door upon which it is placed, two ordinary knobs are seen, the turning of one of which brings the tumblers into the proper position for allowing the bolt to be drawn, while the other draws the bolt. Without these knobs the lock cannot be worked, and if they are removed, no opening is presented by which a rogue can introduce any powder, nitro-glycerine, or in any other manner gain insight or entrance into its mysterious combinations.

This is a lock in which a series of rotating, annular tumblers is employed, and it consists in a novel arrangement of such tumblers, in connection with one or more arms, connected with one or more bolts, whereby an extremely simple and effective lock is obtained, presenting an almost unlimited number of combinations. The interior of the lock presents four concentric rings, which are allowed to turn freely by means of spring pawls and ratchet teeth, worked by turning forward and reverse one of the before mentioned knobs. Each ring is provided with an annular flange or ledge, which ledges form the tumblers—three in number. These flanges have each a recess, and by turning the rings, with their flanges containing the recesses, which is done by means of the knob upon the outside and the rachet teeth, the recesses upon each ring are brought into a direct line, through which the bolt may then be drawn. The art consists in so placing the flanges that they may all be in a direct line to admit of the drawing of the bolt. The springs or pawls make a distinct click, which may be heard by the ear, and a jar, which may be felt by the hand, each time one of the teeth in the rings is made to pass the spring. Each ring has one long tooth, the passage of which under the spring may always be known. The ring is turned by the knob until this long tooth is made to pass the spring; the position of the recess of the flange belonging to that ring is then known, and the operator, who has the combination upon which the lock is set, knows, then, by counting the clicks as each tooth passes the pawl, how many teeth to move the ring before the recess comes to its proper place for allowing the bolt to be drawn.

Each of the other rings are placed in position in the same manner, and when all are properly placed, the bolt is readily drawn. The lock which was submitted to our inspection, consisted of one bolt and four rings. The number of combinations under which it could be set was over 600,000. Any desirable number of rings and tumblers can be added, each additional ring increasing with an immense proportion the numbers of possible combinations. The rings may be set and turned by figures, by letters, by words, or by characters. The lock is exceedingly simple in its construction, and can be made at a moderate expense.

A portion of the claims of the patentee consists in the employment or use of a series of annular tumblers, as above described, provided respectively with teeth and pawls, and also with annular tumblers notched to operate in connection with notched arms, through which the bolts are moved; he also claims the peculiar construction of the arms applied to the bolts and arranged with the tumblers as above described. These locks may be seen on the vault of the Bank of British Columbia, corner of Sansome and California streets, and at Kittridge & Leavitt's Pioneer Iron Works, corner of Battery and Jackson streets. Parties desirous of examining the lock can have the opportunity of doing so by calling at either of the above places. They will soon be placed on the vaults of several other banks in this city. Any orders for these locks left at Kittridge & Leavitt's, as above, will be promptly attended to. Application can also be made direct to the inventor at the International Hotel, or to Markt & Fleishel, locksmiths, 18 Post street, where they are manufactured. Applications for patents have been made in all the most important countries of Europe—through the MINING AND SCIENTIFIC PRESS PATENT AGENCY.

BANK OF BRITISH COLUMBIA,
San Francisco, May 24, 1866.

Recently, two of Wm. C. Bussey's new patent Combination Burglar-Proof Locks were placed upon the vault doors of the Bank of British Columbia. They are found to operate with all the efficiency claimed by the inventor, and in every way meet our fullest approval.

They were ordered upon mature deliberation, after strict investigation of their merits, in comparison with some of the most noted and popular old styles of combination locks.

We deem the lock entirely burglar-proof. It is strong in construction, without intricate or delicate parts, with simple and easy movement. We find no difficulty in either opening or closing it, nor in changing its combinations, which may be made almost innumerable.

As a California invention of extraordinary merit, we take pleasure in recommending it to public attention, believing it to possess all the advantages which are claimed for it.

W. M. H. TILLINGHAST,
Sub-Manager.

A NEW MOTIVE POWER FOR SEA GOING VESSELS.

Mr. A. F. Yardell, of this city, has submitted to our inspection a model and illustrative drawings of a plan which he has devised for propelling vessels at sea by the motion of the water, or rather by the vessel's own motion, produced by the rolling of the sea. His mode of accomplishing this purpose is to suspend a heavy weight, which may consist of a portion of the cargo itself, with arms and levers so connected with the piston of an air pump, that the vibrations of the suspended weight is made to force atmospheric air into a strong reservoir, similar to a steam boiler; which air, so compressed, is made to drive an engine precisely as steam is employed to drive the wheels or screw of a steamer. Or the power may be taken from the levers, and applied directly to a series of paddles, as shown in his model. Two air pumps are employed, one of which is worked by the fore and aft pitching of the vessel, and the other by her side or rolling motion.

The weight employed is confined in two or more huge iron cribs or cages, hung in such a manner as to swing freely with the motion of the vessel, and very much like a compass in the binnacle. Calculations of the power which might be thus obtained, appear to indicate that from one-fifth to one-quarter of the weight of the cargo capacity of a sea-going steamer would give her more propelling power, under ordinary conditions of the sea, than is derived from the usual amount of steam power carried. Competent mechanics, to whom the model has been submitted, are unable to point out any special mechanical objection to the principle; and several shipmasters have expressed the opinion that the straining and laboring of the vessel will not be materially increased.

This invention is one of those simple, bold and original ideas, which, when once submitted afford matter of astonishment that they have not before been thought of. The whole arrangement is exceedingly simple and compact, and would interfere but very little with the full carrying capacity of a vessel. The other advantages of such a power as described, must be apparent to all. The idea is one well worth a careful consideration, and we trust some of our enterprising machinists and shipmasters will become sufficiently interested in the matter, to secure for the inventor a practical test, which is certainly necessary to clearly determine its value. Mr. Yardell may be found on applying at this office.

THE PACIFIC FORGE COMPANY.—We have already briefly alluded to an important manufacturing establishment, which has recently been put in operation, in this city, near the machine shop of the San Jose Railroad, and known as the "Pacific Forge." This establishment, the only one of the kind on the Coast, is under the direction of Messrs. Hall, Johnson & Co. Its importance to the growing railroad, steamship and other interests requiring heavy forging work, can scarcely be estimated. A crane and trip-hammer has been provided, by which every description of forge work, from a crowbar to a first-class steamship's shaft, can be turned out. These works will afford a ready market for our old scrap iron, which has hitherto been sent to the East and returned to us again in the very shape in which Messrs. Hall, Johnson & Co, now prepare it at our very doors. We have the testimony of Mr. R. Bishop, the mechanical engineer of the San Jose Railroad, that the railroad shafts turned out from this forge are superior to any imported ones. No better evidence of the character of their work, short of actual and long continued trial, can be obtained on this Coast. The forge will soon be running day and night, and its capacity will be increased to any extent which may be found necessary to supply the demand for such work in San Francisco.

TIN ORE ON THE PACIFIC COAST

MESSRS. EDITORS:—I am a reader of your valuable paper, therefore I take the liberty to address you a few lines, asking whether any bounty has been offered for the discovery of a tin mine. I have found a lode of that character that I suppose to be rich in tin; if such should prove to be a fact, and a bounty has been offered, what action is necessary, on my part, to obtain the same. C. A.

We have received the above query from a correspondent at West Point, Calaveras county. With reference to the bounty, we know nothing positively; but have always understood that Congress has offered a very handsome amount for the discovery of a workable tin mine, any where in United States territory, and the production of a certain amount of ore. The payment of the bounty, we presume, is conditioned upon the finding of tin ore, *in place*, and not its mere accidental occurrence in a stream or placer. Several parties are exerting themselves to secure the bounty, among others Judge James Walsh, who is now opening a number of tin mines in the Temescal mountains, some thirty or forty miles back of Los Angeles. Parties in Idaho also have their eyes upon the same object. If our West Point correspondent has really found a valuable tin mine, he has got a good thing whether he gets any bounty money from Government or not; and it would gratify us to hear of his success in both respects. We should be pleased to see some specimens of ore from the vein which he has discovered.

The first bar of tin ever taken from the ore in this State, was obtained by Dr. Lanszweert, in 1858. Mr. Price, the assayer, smelted a lot of ore and obtained a bar of tin some two years ago. Some four or five tons of tin ore were brought to this city from the Temescal mines, by Judge Walsh last fall, and concentrated, and the concentrated ore shipped to Europe. Both of the latter cases were noticed in the PRESS at the time. There is but little doubt that the Pacific coast will soon be producing tin, in considerable quantity.

The First California Bell.

EDITORS PRESS: Some time ago I saw an article in your paper relative to a bell which had just been cast by W. T. Garratt, of this city, in which it was stated that that was the first bell ever cast in this State. Now the fact is, that the first bell ever cast in this State was cast by Mr. Garratt for the side-wheel steamboat *S. B. Wheeler*, in 1851, by order of John Lochhead, of Lochhead's Steam Engine Works, Beale St., who was at that time engineer on the boat. The *S. B. Wheeler* came to this city the same year in the barque *Fannie*, which was sunk at Benicia in order to float the steamboat out. This bell was cast after many difficulties, owing to the want of experienced workmen. It weighed about seventy-five pounds. The *S. B. Wheeler*, at the time the bell was cast, was running on the Stockton route, and commanded by Capt. Spear, formerly clerk of the old steamboat *Senator*, which in an early day ran between this city and Sacramento. ANTIQUARY.

San Francisco, May 23d, 1866.

OIL.—The Napa *Register* notices a curious discovery at the head of Capel valley, about fifteen miles from that place, a ledge of white quartz, in which are small cavities containing petroleum—a spoonful or so in a place, here and there imbedded in the solid rock. A company, called the Alladin petroleum company, has been formed for the purpose of prospecting. Not long ago quicksilver was discovered in the same vicinity, in its fluid condition, imbedded in quartz. Nature must be subject to spasms in that region. It is only necessary now for the geysers to commence spouting oil instead of water.

SCHOOL HOUSE IMPROVEMENT.—The School-house at the corner of Broadway and Larkin streets is to be raised, and four school-rooms to be fitted up therein.

SCHOOL VACATION.—The present Public School term will close on Thursday of next week, after which there will be a vacation of a month.

THE TRACTORY CURVE, AND THE PROPERTIES OF GRINDING PLATES.

BY W. A. GOODYEAR,
Civil and Mining Engineer.

EDITORS MINING AND SCIENTIFIC PRESS: A few words more upon this subject, in reply to Mr. Randall's last article, will suffice.

In this article he says "I did not presume the weight of the ring plate in any of the cases recapitulated equal to that of the entire plate. It is thus so expressed both by word and formula." I have no wish to misrepresent any of Mr. Randall's words. The suppositions involved in the *results* he gave, are evident enough; but I must confess that I failed to gather from his *words* any clear expression of the fact in question, and on the contrary, the great stress which he laid upon the point, that the plates compared should all be of the *same weight*, led me to suppose that this was a point which he had overlooked, and that here he had failed to see the full bearing of his own formulas.

It is evident from his last remark upon the proportion "S : V : : E : G," that he does not yet comprehend—clearly as I have stated it—the principle which I have assumed relative to the distribution of pressure. I neither asserted nor supposed that he admitted "an *equal* distribution of pressure in plane and conical plates of uniform hardness," nor have I made any such assumption as this myself. I understood his discussion of plate A, and that discussion agrees precisely with the principle I did assume.

In reply to one or two other remarks, I will simply state that I have *not made* any "invention," nor am I, nor have I been in any way *interested* in the success or failure of the tractory conoidal or any other form of grinding plates, beyond the simple interest which every scientific man may take in investigating the truth, and exposing fallacy.

Mr. Randall claims, now, to have refuted from a "practical" point of view the two *main* and *important* points upon which I insisted.

With respect to these *soi distant* refutations, I can only say here, that they, too, are fallacious, resting as they do upon a mass of assumptions and assertions, many of which are more than questionable; but which the SCIENTIFIC PRESS has not the space, nor I the time, to discuss *ad infinitum*.

On subjects like these last, "the authority of practical mechanics" is of course "conclusive," *provided* the "practical mechanics" referred to are men accustomed to *close* and *accurate* observation, *and* provided they have instituted and executed with the necessary *care* and *attention*, the experiments required to settle such points. Otherwise their authority is of no value whatever.

I am of course fully informed of the fact that many comparisons have been already made in this country between the practical workings of the tractory conoidal and other pans, and am also aware that in some cases the results of these comparisons have been *reported* as very favorable for the tractory pan. But in *no case* have I been able to obtain sufficient data to satisfy me that the experiments were made under such conditions as to furnish results which can be *relied upon* as establishing *any principle*. And knowing, as I do, how numerous are the details to be attended to in order to obtain such results in any department of experimental mechanics, and knowing, too, how great is the lack of care with which, from ignorance of mechanical laws, and from other causes, experiments are and have been made, especially in a country like this, I shall continue to exercise my own "reason" instead of that of Mr. Raodall, and to doubt many of his asserted "facts" in this direction, till they are established by better authority than mere assertion.

I do not expect that the results of *reliable* experiments, when such are made, will agree *exactly* with *any* theory; but I do expect that they will approximate a true theory far more closely than his extravagant assertions and built up "demonstrations" would make them.

With these remarks, I drop the subject for the present. Should I ever return to it again, it will hardly be in the way of a public discussion, which shall involve as many slang phrases and personal reflections as the present one has done.

San Francisco, May 21, 1866.

BY EXPRESS.—Two cents per copy will be added to our usual rates of subscription (to pay Wells, Fargo & Co.'s tariff) on papers sent by express. If connecting expresses in the interior make additional charges, subscribers must themselves settle the same.

[Written for the Mining and Scientific Press.]

Remarks.

EDITORS PRESS:—I notice in the *Miner* for May, a long answer to certain "QUERIES" made by me in a late number of your paper. This "reply" requires a few *remarks*. First, then, the original statement in the *Miner* was *not* that gold never occurred in *nature* combined with sulphur. Whatever the author may have *intended* to say, he *actually* made the unqualified assertion that gold *never* chemically unites with sulphur. Now every tyro in chemistry *does* know (and all chemical authorities agree upon this point), not only that hydrosulphuric acid precipitates metallic gold from *boiling hot* solutions of gold, but that it precipitates also the *sulphid* of gold from cold solutions. As to the "information" given us that "the terchlorid of gold is not gold," the author might as well have stated that sugar is not saltpetre. The one statement is as true as the other, and the one has as much connection with the point in question as the other.

With respect to emerylite and Dana, there was no misquotation, and neither myself nor the editor of the PRESS was in error. The quotation was not made without having consulted the *last* edition of Dana. But the quotation itself was made from an earlier edition, because in this edition emerylite is classed as a distinct species, and the description given of it is fuller, while in the last edition it is classed under the species margarite, and less is *said* here of emerylite in particular. There is nothing inconsistent, however, on this point in the two editions, as might be inferred from the fact alone that seven of the eight *analyses* of emerylite given in the old edition are also given *literatim* under margarite in the last edition.

Dana is not in the habit of making errors, which shall necessitate "corrections" to the extent suggested by the writer in the *Miner*.

To the writer of the "reply" himself I would say, in the best of faith, let us not be offended in criticism any more than in asking for information. ENQUIRER.

San Francisco, May 24, 1866.

BOX FACTORY.—One of the busiest institutions in the city is the box factory of Messrs. Hobbs, Gilmore & Co., on Market, between Beal and Main streets. Not less than eighty hands are kept constantly employed at this establishment. Boxes turned out of that manufactory are not only afforded cheaper, but for durability and excellence of workmanship, they are found far superior to those put together at shops where box making is not made a speciality.

PACIFIC POTTERY.—The Pacific Pottery, carried on by N. Clark, Esq., at Sacramento, is one of the most useful of the miscellaneous mechanical institutions in the State. The heavy cost for freight and loss from breakage involved in the distant transportation of the bulky articles of ordinary earthenware, render their manufactory on this coast almost indispensably necessary. J. M. Page, at 42 Clay street, in this city, is agent for the manufacturer.

NEW SEED SOWER.—Mr. Frank. Hill has invented a new grain sower, for which he claims an absence of all disadvantages hitherto attending similar inventions. The sower is constructed somewhat like the old drills used for drilling grain. The wheels, with cogs on the hub, gives motion to sets of parallel teeth working in the oblong box and prevents clogging of the grain outlets. The falling grain strikes on a sharp bar underneath and is scattered in all directions. The inventor will apply for a patent. He has also invented a rolling harrow for stubble fields.

AN ANCIENT BOQUET.—Colonel Howard, of Virginia, Nevada, has shown the editor of the Virginia *Enterprise* a most carefully preserved boquet of flowers, composed of sweet verbena, yellow manstatc, arborvitæ, velvet rose, and blue violets, which was gathered in 1838 from the garden of Robert S. Todd, father of Mrs. Lincoln, wife of our martyred President. These flowers are of course dry and almost colorless from age, being now twenty-eight years old; but they are an interesting relic. The same tow-string binds the package that was on it originally, and the Colonel cherishes these flowers among his best treasures.

Evening Schools.

The May number of the *Teacher* very properly calls attention to the system of Evening Schools, which has recently been introduced as a part of the Public School system of this city, and endorses the suggestion of the city Superintendent, that they should be continued throughout the year, instead of being confined to the winter months, as at first intended. The suggestion is a good one and timely. The practical importance of this branch of our educational system cannot be over-estimated, and should be liberally sustained.

The pupils of the Evening Schools are generally such as without that opportunity would go out into the world deprived forever of the greatest boon we can bestow on our own or our neighbor's children. The past is full of examples of the superior practical benefits derived from instruction obtained under difficulties, to those secured by attendance upon regular schools and academies. The distinguished men who have been thus indebted for their education, far outnumber those who have been brought up and educated in affluence or under easy circumstances. The examples alluded to in the article in the *Teacher*, to which reference has been made, are fully conclusive as to the importance of this extra avenue of popular education.

It is idle to assert that such men] achieved their greatness in spite of the deficiencies and difficulties which have surrounded them in early life; or that the benefit of the forcing system is better illustrated in pointing out the elevation of an inferior order of minds to positions of honor and trust. There is a degree of practicability and adaptation attending education so obtained, that is much less frequently met with in persons who have spent an unceasing attendance, during their minority, upon schools, academies, and the higher institutions of learning. We can never fully realize the value of a thing, unless we have striven to attain it.

SELECTIONS FOR A NEWSPAPER.—Most people think that the selection of matter for a newspaper is the easiest part of the business. How great an error. To look over and over hundreds of exchange papers every day, from which to select enough for one, especially when it is not what shall, but what shall not be selected. If every person who reads a paper could have edited it, we would hear less complaints. Every subscriber takes the paper for his own benefit, and if there is nothing in it that suits him, it must be stopped; it is good for nothing. Just as many subscribers as an editor may have, so many tastes has he to consult. One wants something sound: one wants anecdotes, fun and frolic; and the next one wonders why a man of good sense will put such stuff in his paper. Something spicy comes out and the editor is a blackguard. Next comes something argumentative, and the editor is a dull fool. And so, between them all, you see the poor fellow gets roughly handled. They never think that what does not please them pleases the next person, but they insist, if the paper does not suit them, it is good for nothing.

A WOMAN'S tears often soften a man's heart, her flatteries his head.

KEEP that man at a distance who hates music and the laugh of a child.

AGE is venerable in a man, and would be in a woman—if she ever became old.

MEN slip on water when frozen, and on whiskey when it isn't.

VALUABLE MINES!
FOR SALE
IN NEVADA COUNTY.
FOUR VALUABLE QUARTZ MINES, SITUATED AT THE base of Deer Mountain, and about equi-distant from Grass Valley and Nevada City, are now offered for sale. These ledges run parallel with each other, are wide and well defined, varying from fifteen inches to four feet in width, and have been sufficiently developed to prove them to be of great prospective value. One of them is an extension of the famous Star Spangled Banner. A shaft has been sunk on the extension to a depth of thirty feet, where the ledge is fully two feet wide, and prospects quite as well as the Banner did at that depth. On account of water, further progress downward was impossible without machinery. These claims are accessible at all seasons of the year, and wood and water exist in their immediate vicinity in great abundance. Parties who would prefer putting up machinery and sinking on one or more of these claims, for an interest in them, can do so, and liberal terms will be granted by the present owners.
Persons desiring to purchase claims, or erect machinery to prospect the same, will find this a capital chance. For further information, reference may be had on application to the Editors and Publishers of the MINING AND SCIENTIFIC PRESS, 505 Clay street, San Francisco. 21v12

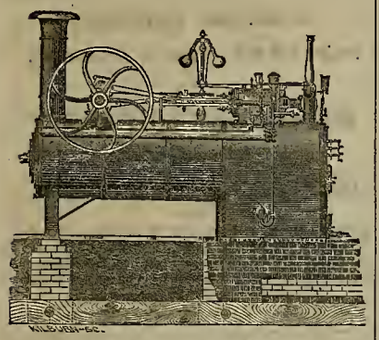
Portable Steam Engines!

"Hoadley's" and "Hittinger's" Make,

HOADLEY'S.

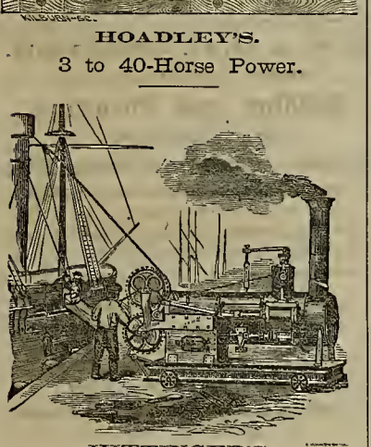
FOUR SIZES,

8, 10, 12, and 15-Horse Power,



HOADLEY'S.

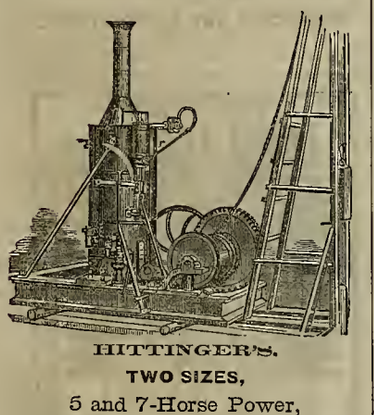
3 to 40-Horse Power.



HITTINGER'S.

THREE SIZES,

5, 7, and 10-Horse Power,



HITTINGER'S.

TWO SIZES,

5 and 7-Horse Power,

COMBINING THE MAXIMUM OF EFFICIENCY, DURability, and Economy, with the Minimum of weight and price.

These Engines are favorably known, a large number being in use on this coast for hoisting, pumping, threshing, milling and mining purposes

Steam can be got up on these Engines in fifteen minutes after reaching the place of operation, and the time, expense of setting boilers, machinery, and "construction account" saved, (which is often the difference between the successful and unsuccessful prosecution of milling enterprises,) in fact, the portable principle is the pioneer's friend, and enables him to draw engines on their own wheels to his cabin door, and plant on the outermost confines of civilization the saw and grist mill, and it has done and will do more to help subdue the continent than any other of the modern motors which are crowding society and normalizing the world.

All sizes on hand from 3 to 30 horse power, with and without carriages.

Also, Portable Saw and Grist Mills.

For sale by TREADWELL & CO.,

18v12 Corner of Front and Market streets.

Practical Mining School,

Bryant Street, Between Third and Fourth,

SAN FRANCISCO.

THE Proprietors are at all times prepared to work or test Ores sent to this establishment—either in large or small quantities—by such process as may be found best adapted to their chemical character, after a careful analysis has been made. Test lots of Ore adapted to the smelting process attended to. Sulphuret, pyritous, and the (so-called) "rebellious ores," are having especial attention paid to their successful treatment. Assaying in the humid and dry way. Also, refining by cupellation, done at moderate rates.

PRACTICAL MINING SCHOOL.

The proprietors—encouraged by numerous applications from gentlemen desirous of pursuing the study of practical metallurgy—have concluded to admit parties on reasonable terms. Having in their Mill all the necessary appliances for crushing, roasting, amalgamating, smelting, refining and assaying, as also a well extended Laboratory for the analysis of Ores and Minerals, a good opportunity is here offered to acquire a sound practical knowledge of the business:

S. P. KIMBALL, J. R. MURPHY.

[Written for the Mining and Scientific Press.]

Letter from Mammoth District, Nevada.

EDITORS PRESS:—I noticed an article in your issue of the 28th ult. that gives me no little surpriss, as coming in apparent sincerity from San Francisco capitalists. We of this section had long since ceased to look to that quarter for the capital with which to build our mills and open our mines, thinking your solid men had become thoroughly disheartened by the willfully ignorant mismanagement and misapplication of their funds elsewhere in the earlier and unsettled days of silver mining. The portion of the article referred to is as follows:

"If sufficient ore of a class that would *assay* $75 per ton could be obtained to constantly maintain a small mill at work, we understand it is probable that if encouragement were given, some parties in San Francisco would venture on a trial."

In relation to the Austin mines (to which the article above seems more particularly addressed), I have but little to say *pro* or *con*; although, if my opinion were expressed, it would be decidedly favorable to the richness of the ores of that district; but they already have a large number of the finest quartz mills ever erected, and should now go sensibly to work on their mines before building more.

Let me say that here, in Mammoth district, ample encouragement will be given to parties wishing to erect a mill, and sufficient quantities of ore will be guaranteed, by a glance at our mines, that will *work* seventy-five dollars per ton (to say nothing of assay), and maintain not only a small mill, but one of the largest capacity. We have a great number of lodes varying from one foot to ten feet in width, opened to a depth ranging from thirty to one hundred feet, with pay ore from the surface, of a very tractable nature. We have wood here in the greatest abundance, to be obtained at a price not to exceed four dollars per cord delivered. The owners of these mines are, almost without exception, men who have their last dollar in their mines, and are, consequently, unable to develop them to the extent they would wish; but sufficient work has been done to establish their value beyond a doubt. Without hesitation, I will say that ores which may be worked with large profits by a 20-stamp mill are already in sight, in quantities that will satisfy any one by a visit to Mammoth. We are thirty-five or forty miles nearer the base of supplies than Austin, in the very core of the richest silver region yet discovered. Send on your sincere men who wish to invest their money in an enterprise for the legitimate profits of the mines, and I promise that they shall be pleased, and find far more than asked for in your articles of the 28th.

A. J. HOWK.

Weston, Nye Co., Nev., May 7th, 1866.

A PERILOUS FEAT.—A blacksmith in Ilminster, England, lately performed a perilous feat. A child aged seven years, while playing with his brother, aged 12 months, placed over his head an iron band similar to that used for the hubs of cart wheels. The child's neck began to swell, and when the parents discovered it they were horrified to find that it was impossible to remove the band, and that suffocation was imminent. A blacksmith named Coles was called in, and suggested the desperate idea of hammering off the iron with a sledge, and he successfully completed his task. While one person held the legs and another the head of the little one, Coles fearlessly struck at the ring and severed it. A false blow of half an inch would have caused instant death.

A NEW RUDDER FOR SHIPS.—A new ship rudder has been experimented with at Havre, France, in the presence of a number of naval officers and shipbuilders. It is composed of four pieces connected by hinges in place of one solid piece. By means of these joints the rudder when set in motion by the tiller presents a curved surface to the water in place of flat surface. The object is to give both a greater flexibility and a stronger action to the rudder. During the experiment it was attached to a large boat, which it is said to have brought round instantly.

SIMPLE PROCESS FOR SILVERING.—An employee of the Bavarian Mint has patented an improved process for silvering copper, brass, and other alloys by means of a solution of silver in cyanide of potassium; the difference from the usual method consists in the use of zinc-filings, with which the objects are coated; when the silvering solution is applied, an immediate deposition of a much more durable character taking place. The filings are easily removed by rinsing in water, and may be used repeatedly for the same purpose. Metallic iron may be coated with copper in the same manner, by substituting for the silver a solution of copper in cyanide; and over this copper deposit a coating of silver may be applied.

THE following verse contains all the letters in e alphabet, and may be used as an exercise for oung children in tracing the letters :

"God gives the grazing ox his meat,
And quickly hears the sheep's low cry,
But man who tastes his finest wheat,
Should joy to lift his praises high."

THE PACIFIC IRON WORKS,

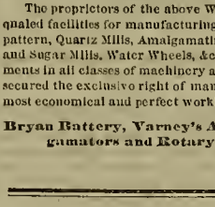
First & Fremont Sts., between Mission & Howard, San Francisco.

The proprietors of the above Works invite the attention of all parties interested to their greatly improved and unequaled facilities for manufacturing Steam Engines and Boilers, both Marine and Stationary, of any required size and pattern, Quartz Mills, Amalgamating, Pumping and Hoisting Machinery of the most approved construction. Flour, Saw, and Sugar Mills, Water Wheels, &c., &c. Our pattern list is most complete and extensive, embracing the late improvements in all classes of machinery adapted to use on this coast. We would call especial attention to the fact that we have secured the exclusive right of manufacture for the Pacific Coast of the celebrated Greene Engine, conceded to be the most economical and perfect working Engine now in use. We are also exclusive manufacturers of the celebrated

Bryan Battery, Varney's Amalgamators and Separators, Ryerson's Superheated Steam Amalgamators and Rotary Crushers, Stone Breakers, &c. Orders respectfully Solicited.

GODDARD & COMPANY.

REMINGTONS'
ARMY AND NAVY REVOLVER,



THE REMINGTON REVOLVER

Has been approved by the United States Board of Ordnance, and has so satisfactorily met the requirements of the Government, not only in the field, but in the official tests and examinations made by prominent officers of the Ordnance Department, that it stands at once the most popular, serviceable and approved arm of the kind in use. Upwards of 125,000 have been supplied to the Government within the past four years, for the land and naval service, furnishing ample evidence of the estimation in which the arms are held.

Simple and symmetrical in its entire construction, securely strong, of most modern improvement in mechanism and material; its unequaled range and penetration, together with its durability, are points in its favor now well known, and which challenge a comparison with any other pistol of the kind made in this country or in Europe.

The superior strength and capacity of the arm for constant and long use is apparent from the fact that the entire frame is constructed of a single piece of metal, thus preventing the extension of some portions of the frame, from the effect of firing—a serious defect in many pistols—in which the frame is composed of two or more parts.

The frame of the Remington Revolver furnishing a TOP STRAP or support above the cylinder, served to protect the base pin (on which the cylinder revolves) from any undue strain to which it would otherwise be subjected, and which would immediately render the line of fire from the cylinder to the barrel imperfect, thus destroying force and accuracy.

Another advantageous feature of the arm is the means afforded for the instantaneous removal of the cylinder from the frame. This not only facilitates the cleaning of the pistol, but by the quick adjustment of the cylinder, one pistol can be made as effectual as two—and, considering the difference of weight, it is far preferable—by simply possessing a spare cylinder loaded and capped to instantly replace the exhausted one.

The above is a general summary of the points of peculiar merit in the Remington Revolver which a trial of the arm is only needed to attest. For sale at Manufacturers' rates, by

Vulcan Iron Works Company

[ESTABLISHED 1850.]
First, Natoma and Fremont Streets.

IRON FOUNDERS,
Steam Engine and Locomotive BUILDERS,
Boiler Makers, and Workers in Sheet Iron, Brass and Copper.

These Works have lately been increased by the addition of new shops on Fremont Street, doubling the capacity of the original establishment. Their facilities for turning out machinery promptly and efficiently, are now unequaled in the State. Their Boiler Works have also been enlarged correspondingly.

The Company are prepared to execute orders for all classes of Machinery and Boiler Work, such as

Mining, Steamship, and Steamboat Machinery,

Railroad Machinery, Locomotives, Car Trucks, Car Wheels, Flouring Mills, Quartz Mills, Sugar Mills, Saw Mills, Hoistings and Irons; and

Manufacturing Machinery of Every Kind.

Sole Manufacturers of

HEPBURN & PETERSON'S REDUCING PAN AND AMALGAMATOR.
BEATH'S AMALGAMATOR;
HESSE & MOORE'S IMPROVED HOWELL QUARTZ CRUSHER;
BAUX & GUIOD'S AMALGAMATOR AND SEPARATOR;
FAUCHERY'S QUARTZ GRINDER AND WATER WHEEL;
JONVAL'S IMPROVED WATER WHEEL;
LEFFEL'S AMERICAN DOUBLE TURBINE WATER WHEELS.
STEVEN'S PISTON PACKING RINGS.

They have also a large assortment of Patterns for Pumping and Hoisting Machinery, Gearing, Pullies, Water Mill Irons, Hydraulic and Screw Presses, Retorts, Furnaces, Grate Bars, House Fronts, Ornamental Fence Posts and Paling, Stove Ranges, etc., etc.

Quartz Stampers, Shoes and Dies, of the best Hard Iron. Quartz Screens of Russia Iron Punched to Order. 27

Occidental Homestead ASSOCIATION,

Office, 305 Montgomery street, San Francisco.

Capital Stock : : : : : : : $33,600

102 Shares, $330 Each.

THIS ASSOCIATION was formed to enable its members to obtain desirable homestead lots in this city, at a cheap and easy rate, paying for the same by regular monthly installments. For this purpose they have purchased blocks 499, 600, and 601 in the Western Addition to this city, bounded by Devisadero, Pine, Broderick and Clay streets. Subscribers will pay an initiation fee of $5 on each share taken, to form a fund for defraying current expenses, and $11 per month for thirty months, commencing in April, 1866. The property is within three blocks of the Turk Street Railroad, is nearly all on the grade, and is most desirably located for homestead purposes. It is directly east from the lands of the California Homestead Association. The property has been purchased on very reasonable terms, and offers a rare opportunity for investment. A number of fine houses are in process of erection, and streets are being graded near this property, which will greatly increase its value.

When twelve monthly payments have been made, the property will be divided among the members in the usual manner, and each shareholder will receive a contract for a deed to the lot or lots to which he may be entitled, and have the privilege of taking immediate possession of the same. The lots average 27 feet in front by 120 feet in depth. The whole amount due upon any lot may be paid at any time, and discount at the rate of 1½ per cent. per month will be deducted therefrom. Persons wishing to visit the lands of this Association will take the Turk street cars to Devisadero street, and thence go northerly along Devisadero to Pine street.

$20,000 of the capital stock is taken, and the books are open for subscription to the balance, at the office of the Secretary, where the Official Map of the Association can be seen, and all particulars obtained.

The Title to this property is perfect.

J. S. LUTY, Secretary.

Office 305 Montgomery street, corner of Pine, Rooms 2 and 6. 20v12-tf

ANNUAL REPORT
—OF THE—
Pacific Insurance Company.

IN COMPLIANCE WITH THE ACT OF THE LEGISLATure of the State of California, entitled "An Act concerning Corporations," passed April 22, 1850, the Pacific Insurance Company of San Francisco makes the following Annual Report:

I.—The amount of the Capital Stock of this Company is SEVEN HUNDRED AND FIFTY THOUSAND DOLLARS, and paid in GOLD.....$750,000

II.—The amount of the Assets is ONE MILLION AND FIFTY ONE THOUSAND, FOUR HUNDRED AND TWENTY DOLLARS AND THIRTY-SEVEN CENTS..$1,051,420.37

III.—The Company has NO DEBTS

IV.—The amount of insurance effected during the year, and which remained in force December 31, 1865:

Fire.....$12,973,949
Marine..... 481,408

This Company commenced underwriting Marine Risks, August 1, 1865.

V.—This Company insures against the following risks, viz:: BUILDINGS, HOUSEHOLD FURNITURE, MERCHANDISE, RENTS, LEASEHOLDS, VESSELS IN PORT AND THEIR CARGOES, and other PERSONAL PROPERTY, AGAINST LOSS OR DAMAGE BY FIRE.

Also, on CARGOES, TREASURE, COMMISSIONS, PROFITS, and WAR RISKS, and ON ALL MARINE AND INLAND NAVIGATION RISKS, TO AND FROM ALL PORTS IN THE WORLD.

VI.—This Company will take on any FIRST-CLASS RISK not to exceed $75,000 (the limit fixed by law), and on all large risks will reinsure to an extent consistent with PRUDENCE in other RESPONSIBLE COMPANIES.

FLORENCE
SEWING MACHINES!

COPY OF THE REPORT OF THE COMMITTEE OF AWARDS AT THE FAIR OF THE

AMERICAN INSTITUTE,
New York, 1865,
—TO THE—
Florence Sewing Machine Company,

FOR THE BEST FAMILY SEWING MACHINE.

HIGHEST PREMIUM—GOLD MEDAL!

REASONS:

1st.—Its simplicity and great range of work.

2d.—The Reversible Feed Motion.

3d.—The perfect finish and substantial manner in which the machine is made.

4th.—The rapidity of its working and the quality of the work done.

5th.—The Self-adjusting Tension.

The "FLORENCE" was awarded the First and Highest Premium at the State Fair of California, the only Fair on the Pacific Coast at which any two double-thread Sewing Machines were exhibited in competition in 1865.

The "FLORENCE" received the only premium awarded by the Mechanics' Institute of San Francisco, in 1864 and 1865, to any Sewing Machine, Sewing Machine Company, or Agent. The claim of a competitor to a medal is without any foundation whatever.

Wherever the "FLORENCE" has been brought in competition with other Sewing Machines, it has always been declared the best. It is the most simple, the most substantial, the most efficient, and its use is easily learned. Every Machine sold is guaranteed in the full sense of the word.

Send for Circulars and Samples of Work.

SAMUEL HILL, General Agent,
20v12-14w 111 Montgomery street, San Francisco.

Rheumatism!!
READ IT! READ IT!!

SACRAMENTO, April 16th, 1866.

H. BOWMAN—DEAR SIR: THIS IS THE FIRST WRITing I have done in two years, and it affords me great pleasure to be able to use my pen in the service of those who are suffering, as I have suffered, by stating the following facts:

I have for two years and upwards been afflicted with CHRONIC RHEUMATISM, and until a few weeks ago I have never found anything that afforded me any relief. For three months of the time I was unable to feed myself, and for the last five months my arms have been so bent that I have not been able to dress myself. I was five months at the Warm Springs, at San Luis Obispo, and three months at a Hydropathic Institute in Stockton, and I have been under the care of six different physicians, in the vain hope of relief. About four weeks ago I was induced by a person who had been cured by it to try a bottle of RICHARD'S REMEDY FOR RHEUMATISM, and in less than twelve hours I experienced great relief. In a few days I was enabled to straighten out my arms, and I have been getting better and gaining in strength and flesh ever since. I have now the complete use of all my limbs, and, for the first time in two years, I am out of pain. I do feel for those who suffer as I have suffered, and if they will take my advice, they will lose no time in giving the REMEDY a trial.

Yours truly, GEORGE TAYLOR.

☞ RICHARDS' REMEDY is for sale by

Important to Californians.—Many inventors have lately had their claims for Patents seriously (and in some cases fatally) delayed by the unqualification of agents who have not complied with the Government license and revenue laws, as well as other new and imperative regulations. These discrepancies, although arising from the inexperiences of honest agents, are none the less dangerous to applicants for patents, whose safest course is to trust their business with none but active and experienced solicitors. THE MINING AND SCIENTIFIC PRESS PATENT AGENCY has strictly complied with the requisitions of the Department, and properly filed all necessary papers as Claim Agents.

Leland Gold and Silver Mining Company, San Francisco Mining District, Arizona Territory.

THOS. W. COLBURN,

Secretary Whitman C. & S. M. Co.

San Francisco, Cal., May 12th, 1866. my12 4t

Yankee Blade Mining Company, Reese River Mining District, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 10th day of May 1866, an assessment of twenty-five dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, No. 329 Montgomery street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the 18th day of June, 1866, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the ninth (9) day of July, 1866, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

WM. T. ATWOOD, Secretary.

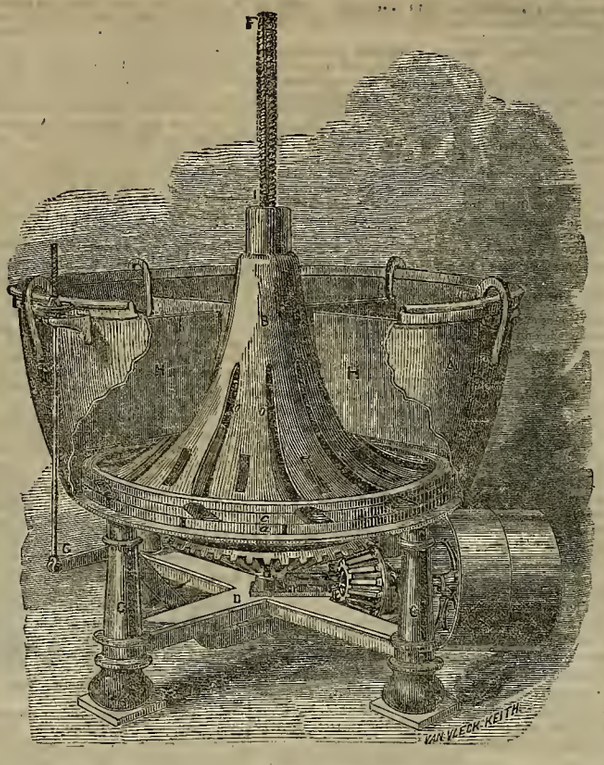
Office, No. 329 Montgomery street, San Francisco. my19

Economy in Advertising.—The MINING AND SCIENTIFIC PRESS is the best and most ECONOMICAL mining advertising medium in this city. Our terms are less than ONE-HALF the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The PRESS contains, proportionally, a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

Book Printing should be considered and treated as one of the higher branches of the "Art of Arts," and its execution entrusted only to experienced and intelligent workmen. Strict attention will be given to all orders for BOOK AND PAMPHLET PRINTING entrusted to the Mining and Scientific Press Job Office.

THE EXCELSIOR
GRINDER AND AMALGAMATOR.

In the engraving herewith presented, A represents the Rim of the Pan; B, Muller; C, Legs; D, Cross-Frame; E, Gearing; F, Screw; G, Lever; H, Dash-Boards; I, Key; *a*, Dies; *c*, Shoes, and *o*, Openings,



Ths relativs grinding capacities of "The Excelsior" Grinder and Amalgamator, of the Flat Bottomed Pan, and of the Conical Pan *when properly constructed*, are respectively 177, 98 and 110.

That is, the respective mullers heing of the same diameter, same weight, same hardness, and running at the same velocity "The Excelsior Grinder and Amalgamator" will rednce one hundred and seventy-seven tons of ore, ths Flat Bottomed Pan ninety-eight tons, and the Conical Pan one hundred and ten tons to ths same degree of fineness in the same time.

The wear to the Shocs and Dies at their grinding surfaces in the Excelsior Grinder and Amalgamator, is perfectly uniform, thus securing evenness of reduction to the pulp, as well as steadiness of motion to the muller. Uniform wear of ths grinding plates has been attained in no other than that of the Tractory form—nor can it he.

Another property of excellence in this machine is that the metal or substance to he amalgamated passes *direct* from the grinding surfaces into ths quicksilver; thus excluding the possibility of its hecoming coated with any foreign substances, after having been hurnished. It is truthfully said "that the Tractory-formed Pan as a Grinder has no equal, and as an Amalgamator no superior."

As a whole, it is far superior to any other pan in nse.

HUNTER'S

Premium Cnocentrator!!

Awarded a Silver Medal at the Mechanics' Fair of 1865.

THE ADOVE MACHINE HAS BEEN RECENTLY IMproved and simplified, doing away with all complication and friction, therehy requiring less power and speed. As Improved, 125 revolutions per minute is the regular speed required, but any speed varying from 100 to 135 revolutions does not change the results. It is the only machine built on the Pacific coast that is perfectly adjustable for all the different grades of ores, and will save ten per cent. more sulphnrets than any Coneentrator in use, and is the cheapest, from the following list of prices:

For a single machine of the capacity of five tons in twenty-four hours, as it passes from the battery or pans, $125, For double machines of two, three, or four tables in one frame, each table of five tons capacity, $100.

I have been running machines for the past three months at Grass Valley, therefore I make my assertions from a practical working test, where several of the machines are working. Persons desirous of seeing the machines running, can do so at Empire Mill, Grass Valley, where twelve machines can be seen in operation, or in San Francisco, at 118 Washington street, below Davis, where ALBERT JACOBS will fill their orders promptly.

"Safety Cages."

(PATENT GRANTED.)

MINING COMPANIES

WILL FIND IT TO THEIR INTEREST TO ADOPT "Berry, Hochholzer & Denver's Safety Cage" in their hoisting works. It requires very little more work to manufacture than the ordinary style of cages—any blacksmith can make it. It has been PROVED TO BE PERFECTLY SAFE, is self acting and very light, and will, in the item of rope alone, pay for itself in a short time.

The proprietors refer to the following mining companies, among others, that are now using this Safety Cage:—Gould & Curry, Savage, Ophir, Mexican, Empire, Overman and Justis.

For particulars and terms, apply to

HUGO HOCHHOLZER,
Virginia City, Nevada,
15v11tf Through Wells, Fargo & Co's Express.

19v12 416 Market street, San Francisco.

To Ditchmen, Millmen and Others Requiring IRON PIPE.

M. R. ROSE, CORNER OF 9TH AND K STREETS, Sacramento City, has facilities unsurpassed on this coast for the manufacture of IRON PIPE of every description. He also has on hand a deep well FORCE PUMP, of his own invention and manufacture, well adapted for oil wells. His tools being portable, pipe can be manufactured on the ground. 19v12

[Written for the Mining and Scientific Press.]

Letter from Yuba County.

THE BROWN'S VALLEY MINES.

EDITORS PRESS:—Among the mines in rich quartz-hearing sections deserving mention, ars those situated at this place. As yet no extended notice has been taken of them, though from their richness and character they havs dserved it. There are in the town nnd vicinity five mills, some of them large nnd flourishing. The most important mins, in point of wealth and permanency, is the

JEFFERSON,

Sitnated just sonth of the town, npon the most valuable pnrt of ths ledgs yet discovered. Escorted hy the saperintendent, Mr. W. P. Jones, we examined the mine and mill, and were satisfied from nppearances and facts kindly furnished, that this mine is destined to he very rich and lasting. The ledge is of very soft, easily-crushed quartz, and is, from present appearances, inexhaustible in quantity. The direction of the ledgs is from north to south, with an eastern dip, upon which an incline 410 feet deep hns heen sunk, and from which sevea drifts havs heen extended to the north and south. The quartz is of a dark lead color, is almost entirely free from crystalization, and is so soft that large particles are easily broken in the fingers. Some portions of the lead is very rich in special deposits, the gold heing discovered hy the naked eye. As a hopeful evidsnce of the permanency of the miue, the ledge increases in extent ns the incline is carried forwnrd. To facilitats operations, and to he prepnred for any emergency, the shaft is carried one hundred feet in constant advance of ths drifts. The rock now being crushed is called common rock, and yields fifteen dollars per ton; from twenty to thirty tons are crushed per day. The mill is in constant operation with twelve stamps, which, together with the pumping and hoisting works, are driven by an engine of 30-horss power. It is in good condition, but is hardly of sufficient capacity to carry on the operations as fast as the company desire. The stamps weigh 750 pounds each; Varney's pans nre used. To iucrease operations, ths company have contracted for new machinery and will have it erected soon. The new engins will be of 60-horse power, nnd will be used for pumping and hoisting. The mill nnd miue furnish employment for ahout thirty-five men.

Ths next miue here is the

PENNSYLVANIA,

Just one hundred and eighty feet north from ths Jefferson. Success has not crowned the efforts of this company yet; hut a goodly amount of hope acts as a stimulant to energetic labor. The indications are favorahle to the supposition that the ledge of the Jefferson extends tbrough this claim, and an incline dippiag to the east has hcen sunk at an angle of 45°, with the hope of reaching the northern section of the ledge. The incline is now 375 feet deep, being thirty-five feet less than that of the Jefferson. Mr. John Howell, the superintendent, expressed the hope that twenty feet more would open a chnmher of pay rock. Four drifts to the north have been extended from the incline at the mill, and ten additional inclines have been sunk a short distance further nortb. The third incline developed some good rock, yielding from eight to fourteen dollars per ton. No machinery has been erected on this incliae, and its value awaits future development. The operations of the minc have been greatly hindered by vast qnantities of water pouring in faster than two 6-inch pumps could drain it. The water wns pumped out on the 13th instant, aad workmen nre now engnged in exteading the drift. The mill has eight stamps (weigbing 650 ponnds each) aud ten Chils mills, which are used instead of paus. Ths rock presents the same characteristics as ths Jefferson. A beautiful specimen of rich quartz was presented me by one of the employees, for whose kindness I am very grateful. Next in order came the

DANNYBORGE.

The name sounds Scotch, but is Danish. This is the third mill and mine. It lies northwest of tbe town, but a short distance from the main street. The bistory of this miae is somewbat checksred—at one time paying handsome divi-

dends, and at others demanding severe assessmeots. At one stage of its development the moothly yield was about $7,000, besides expeoses, und was a source of large reveooe to its owners. The quartz fouod in the ledge belonging to the mine is rich, bot pitches oboot in such spasmodic changes that it is hurd to follow, the gold being fonnd in what is here called chimneys. No drifting has been done for months, as the mine has been filled with water, which entered iu such quantities as to defy all efforts of the pumps to decrease it. The pumps huve been in constant action all the time, and as the dry season advances, are gaining on the flow, aod the prospect now is that twenty-five more days will drain it sofficiently to allow operations to be recommeoced io the ioclioe. The shaft in this mine dips oorth. The pay streak found, before hindered by the water, was 120 feet wide, over 100 feet below the surface, and pitched east, cutting the shaft at right angles. The shaft is 425 feet deep, with an angle of 40°. The engine used for driving the batteries, hoisting and pumping, is 20-horse power; two 6 inch pumps have been used for pumping. The batteries have twelve stamps (750 lbs each); two Chile mills are used here, same as in the Pennsylvania. As soon as the water is lowered sufficieotly, the work in the drifts will commence, nnd the stamps be put io motion. The gentlemanly superintendent, Mr. Howell—who also superintends the Pennsylvania—expresses the belief that this mine will show in the future the same value that it did in its earlier history, and is confident that the best is yet to be, when further labor increases the base of operations. Of course, nnything prospective, no matter how flattering as evidences, is never a certainty; yet, the past aod present prospects of this mine are favorable enough to keep up a lively anticipation of future richness, and the proprietors are satisfied with it as it stands developed to the present point. Mr. Reis, of the Cosmopolitan, at one time owned one-third interest, but has now sold out. The superintendent gave to your correspondent a fine large quartz specimen, filled full of goldeo stars, and beautiful as it was rich. This was a sample of some of the rock takeu from the ledge some time since. The character of the rock is somewhat different from that of other mines, being more hard and flinty aod containing coosiderable quantity of sulphurets. Pockets are sometimes fouod containing large deposits, and in considerable quantity.

YUBA MILL AND MINE,

Guided by Mr. G. H. Leland, the very agreeable and genial superintendent. We visited this mine and examined its parts. It is situated about half a mile oorth of the Dannyborge, aud is supposed to be upon the same ledge. Lying between these mioes are the Daoiel Webster and Paragon, that are as yet simple claims, no labor being done more than sufficieot to hold them. The operations at the Yuba are discontinued for the present, but are to commence about the 24th of this month. From the present incline rock has been takeo which yielded $33 per ton, and prospects are hopeful of increase in quantity. The mill is new and in good working trim. The engine, of 30-horse power, is of the finest style, and was built to order by the Pacific Works of your city.

SODIUM AMALGAM.

Mr. Leland, acting from suggestions io your journal, has been giving attention to the action of sodium-amalgam, nnd is satisfied that it is just the thing for saving the gold io the fine floor state.

CONCLUSION.

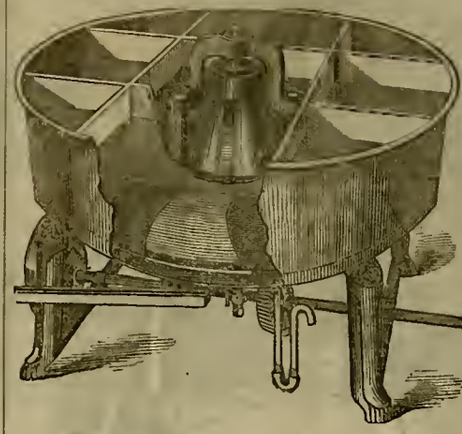
I forgot to state in the proper connection that the Jefferson is paying moothly divideods of ten dollars per share. I have fouod from conversation with the reliable practical men here, that capital to develop is the maio deficiency, and that until the attention of capitalists can be obtained, that the majority of the mines will remain io an undeveloped state. Though many of them may be worth millions, the local capital is insufficient to their development. Many of our moneyed men who give so much attention to mines of prospective wealth in the distant territories, might do better by confining their operations nearer home, aod by atteotion to home ioterests might work with advantage to themselves and the State. W.

Brown's Valley, May 15, 1866.

BORAX IN LAKE COUNTY.—The Napa *Register* says the Company owning the borax mines in Lake county, have made extensive preparations for takiog out large quantities of borax this season. This mineral is dug io crystalized masses from the bottom of Clear Lake, where it is deposited by springs. A large movable coffer dam is suok in certain parts of the lake, which, on being pumped dry, allows the workoen to search the muddy bottom for borax crystals. These are afterward purified in vats aod paos and sent to Sao Francisco *via* Napa City. Thirty teams will sooo be running between Napa City and Clear Lake, for the transportatioo of this mioeral, making weekly trips of a ton to a load.

Knox's Improved Patent Amalgamator and Separator,

With Palmer's Patent Steam Chamber or Die.



THIS CUT REPRESENTS AN AMALgamator and Separator that has stood the test of EIGHT YEARS' practical working in the gold mines of California, and for nearly the same time in the silver mines of Nevada, having been introduced into the first steam mills built in the then Territory, since which time they have been successfully working against all competition.

The great advantages these Amalgamators have over any others, are—

1st. **Much less Cost.**

2d. They do not "flour" the mercury, and collect any that may have been "sickened" in the battery or grinders,

3d. The "sloshing" motion given to the pulp (by the revolution of the muller under the stationary frame) against the amalgamated copper plates that are fastened to the frame, and by this means catching the fine gold aod mercury that will not settle.

4th. The gate in the cone, through which the pulp is discharged, from the top, and where there is the least motion, almost precluding the possibility of any granulated mercury or fine gold escaping.

There are over 500 of them in use in California and Nevada, where those interested can see their practical workings.

A RARE CHANCE FOR INVESTMENT.

THE PATENT RIGHT FOR SALE

FOR STATES, TOWNS AND COUNTIES.

For the Best Chimney Top

Ever invented. Numerous testimonials from Proprietors of Factories, Foundries, Steamers, Hotels, etc., can be shown, attesting to its usefulness in creating draft, saving the expense of high chimneys, and a great saving of fuel.

Pamphlets containing descriptive drawings and testimonials will be sent free, upon application by letter or otherwise to the patentee,

B. A. HENRIKSEN,
Or J. E. JOERGENSEN,
12v12-3m No. 328 Kearny street, San Francisco.

Union Amalgamator.

This Valuable Invention

IS FAST FINDING ITS WAY INTO GENERAL USE, NOT by means of combination of capital and influence, but on the strength of its own merits, and upon the principle that what is known to be good will be appreciated. Practical men acknowledge the UNION PAN to be scientific, the best, the cheapest, and most profitable. It now stands first on the list of all pans in use for the purpose of

Working Gold and Silver Ores.

It has been found that a low class of ores, also tailings from Mills, Sulphurets, etc., that will not pay to work with the common pans, may be worked with this and obtain large profits. The UNION PAN is manufactured in two sizes, and capable of operating upon large quantities of ore in the most efficient manner.

Parties interested in Quartz Mining, Mills, etc., will find it to their advantage to call and examine for themselves, and see its operation.

Gold and silver ores tested by regular mill process, at moderate cost, by

STRONG & CO.,

San Francisco Foundry, corner Mission and Fremont streets, where orders will receive prompt attention.
15v12-3m

BAUX & GUIOD'S

Separator & Amalgamator

Is the most important improvement in mining machinery ever introduced. It was awarded the FIRST PREMIUM at the San Francisco Mechanics' Fair for 1864, where it proved itself to be the best Separator and Amalgamator among all the competitors. Constructed on principles which combine SCIENTIFIC KNOWLEDGE WITH PRACTICAL EXPERIENCE, these Pans extract more gold and silver from their ores than any others in use, as a few hours trial will demonstrate. Mill men will find it to their advantage to employ these pans as Separators, in addition to the ordinary Amalgators now in use, and to re-work their old tailings.

The cost of these pans is inconsiderable, and their structure is such that they can be readily separated in parts convenient for packing on mules. Among the many advantages possessed by BAUX & GUIOD'S Pan, are the following: The trifling cost for attendance; Its small cost; Its portability; The large quantity of pulp it can operate upon in a given time; It may be worked even weeks without stopping as it is constructed to work continuously; The complete thoroughness of the separation of the rock from the metals and the trifling power required to work them; They can be attached to any ordinary crushing apparatus.

We have the pleasure of referring parties interested to the following parties, who have our Pan in use: Jeffersonian Mining Company, Bowman's Ranch, Nevada county; The French Mill, Nevada City; Grail's Gravel Cement Works, Nevada county; Wallman's Chlorination Works, Nevada, Cal.; Gold Hill Quartz Mill, Washoe.

Manufactured at the Vulcan Iron Works and San Francisco Foundry, San Francisco, and at Heugh & Thom's Foundry, Nevada City.

For further particulars, or to see this Pan in operation, call on or address

J. B. BAUX,
Fremont Street, near Mission, adjoining the San Francisco Iron Works, San Francisco. 4v8-6d

NEW MINING PUMP.

Excelsior Double-Acting Suction and Force Pump.

W. D. Hooker's Patent, August 15, 1865.

THE SUBSCRIBERS OFFER FOR SALE the following sizes of the above-named celebrated Pump, acknowledged to be the best Double Acting Pump known to be in use. They are more easily set in position, and are more durable and compact than any other Double Acting Force Pump; they are also worked with very little friction, and have greater forcing power than other pumps of like size. They are adapted to work by hand, wind-mill, horse, or steam-power.

No. 1—Cylinder 2½ in., stroke 6 in.
No 2—Cylinder 3 in, stroke 7 in.
No. 3—Cylinder 4 in., stroke 10 in.
No. 4—Cylinder 5 in., stroke 15 in.
No. 5—Cylinder 6 in., stroke 18 in.

The Nos. 4 and 5 are Mining Pumps.

We have also for sale a full assortment of Pump Fixtures, such as Iron Pipe, Hose, Brass Goods, etc.

J. W. BRITTAN & CO.,
12v12-3m 120 Front street,

VARNEY'S
PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setlers for themselves, at the PACIFIC FOUNDRY,
1v1 San Francisco.

Judicious Resolutions.

Several of our most substantial and judiciously managed mining corporations have passed resolutions, since the approval of the new assessment law, requiring all notice of assessments and sales to be published in the MINING AND SCIENTIFIC PRESS, the only thorough (daily or weekly) mining journal on this coast. Our efforts to concentrate all mining advertisements in one paper, for the economical convenience of shareholders and assessment payers, are meeting with decided success. Those who believe in supporting the mining cause, should bear our paper in mind, and bring up this subject at the next trustee or shareholders' meeting.

San Francisco, April 7th, 1866.

New Mining Laws of California and Nevada.

We have just issued, in cheap edition, the new laws relating to mining and corporations in California and Nevada, passed in 1865-6. Some of these laws are of the highest importance to parties interested in the matter of locating and holding claims, and prospecting mines, in these States. Copies sent by mail. Price, 25 cents.

Address, DEWEY & Co., Patent Agents.
San Francisco, May 1st, 1866.

FOSSILS IN OREGON.—The Dalles *Mountaineer* of April 27th, publishes a communication from L. L. Rowland in regard to the recent discovery of some fossils. We quote:

"Col. Fulton and myself took this morning from a newly washed gully, in the hills near Ten Mile creek, from its long resting place, some eight or ten feet below the natural surface of the earth, a huge tusk, six feet long and twenty-three inches in circumference at the large end, and to all appearance, considerably shortened by decay. While taking ont the aforesaid tusk, another was found within a few rods of the same spot, about sixteen feet beneath the surface of the earth, much larger than the first; but not having time to take it ont at once its length and dimensions are yet undetermined. On returning from the scene of the discovery of these tusks, another was found near by, of about the size of the largest of those mentioned above.

A few days ago, at abont a mile from the place where our discoveries were made, a large piece of a tusk was found projecting from a gravel-bank at the depth of twenty-five feet from the natural surface of the ground."

JOHN SWETT, Esq., State Superintendent of Public Schools, is making a tour of the Northern counties, delivering lectures.

J. B. CONE, BUSINESS AGENCY.—Makes private sales of Property and Business Places of every description, in the city and throughout the State; procures partners with large and small amounts of money; negotiates sales of mining property, and does a General Agency Business. Patronage solicited by mail, express, or by personal application at the office, 402 Montgomery Street, San Francisco, California. 23v11tf

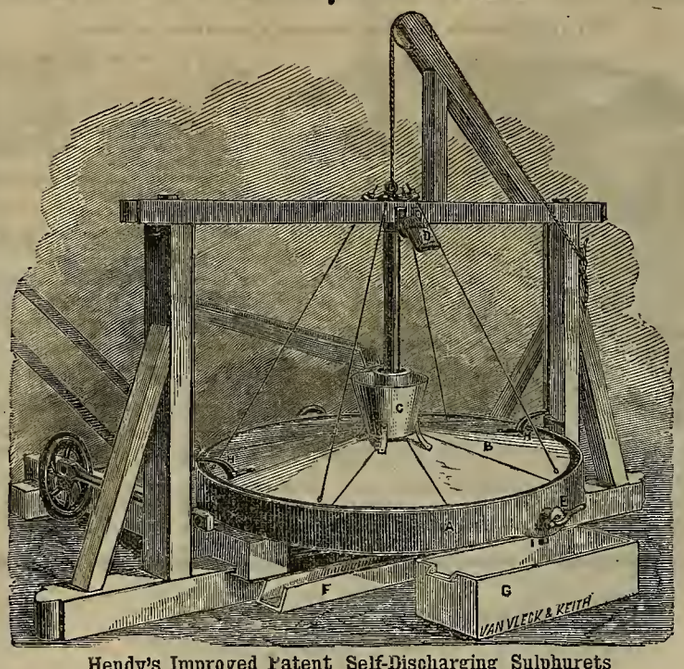
TRY IT 50 PER-CENT SAVED BY USING
STANDARD SOAP COMPANY'S
"WASHING POWDER."

THIS POWDER IS SUPERIOR TO ALL OTHER PREparations for washing and cleansing. It is made of pure material, and contains nothing that will injure the finest fabric. Equally as good for using in hard as soft water. One pound will make three gallons of beautiful soft soap. Put up in wrappers of 1-lb each, and in wooden boxes of 10-lbs bulk. Ask your grocer for a package, and test its virtue. Manufactured at 207 Commercial street, San Francisco. 15v12q

NOTICE TO QUARTZ MINERS.



Hendy's Improved Patent Self-Discharging Sulphurets
PRATER CONCENTRATOR
Is Receiving Universal Favor.

Reference is made to the following Mills which are using the Prater Concentrator, with some of the improvements attached. The Self-Discharging Sulphurets has been more recently adapted, and the public attention is called to examine its workings:

STEPHENS' MILL, Humboldt County, Nevada.
CHRYSOPOLIS MILL, " " "
U. S. REESE RIVER MILL, Austin, "
UNION MILL, El Dorado County, near Mud Springs.
NEW YORK AND EL DORADO CO. " "
CONEY MILL, Jackson, Amador County.
Messrs. TUBBS & CO'S MILL, San Andreas, Amador Co.
WINTER'S MILL, Angels Camp, Calaveras County.
CLIO MILL, Jacksonville, Tuolumne County.
CARROL & ASPINWALL MILL, Reese River, Nevada.

And in use in other parts of this State; also in Idaho, Arizona, Colorado and Mexico.

As a further evidence of its worth, orders have been received recently from the proprietors of the following mills, all of whom are using these Concentrators, or have works in the immediate neighborhood of mills using them, viz.:

One Concentrator ordered for the Coney Mill, Jackson, Amador County, by Messrs. Bigelow & Bro., of this city.
Three Concentrators for the Spring Hill Mill, Volcano, Amador County.
Two Concentrators for the Golden Gate Mill, Volcano, Amador County.
Four Concentrators for the Raw Hide Ranch Mill, Sonora, Tuolumne County.
Six Concentrators for the Benton Mill, Bear Valley, Mariposa Co; ordered by Messrs Dodge & Bro, San Francisco.
They may be seen in operation at the GOLDEN STATE FOUNDRY, No. 19 First Street, San Francisco.

☞For explanation of the above engraving, and other particulars, send for a Circular.

SIEMENS' HEATING FURNAOE.

The *American Artizan*, New York, sends us following illustrated description (by Dr. Crace Calvert) of aa important improvoment in heating furnaces, invented by Mr. C. W. Siemens, F.R.S, of Great George street, London:

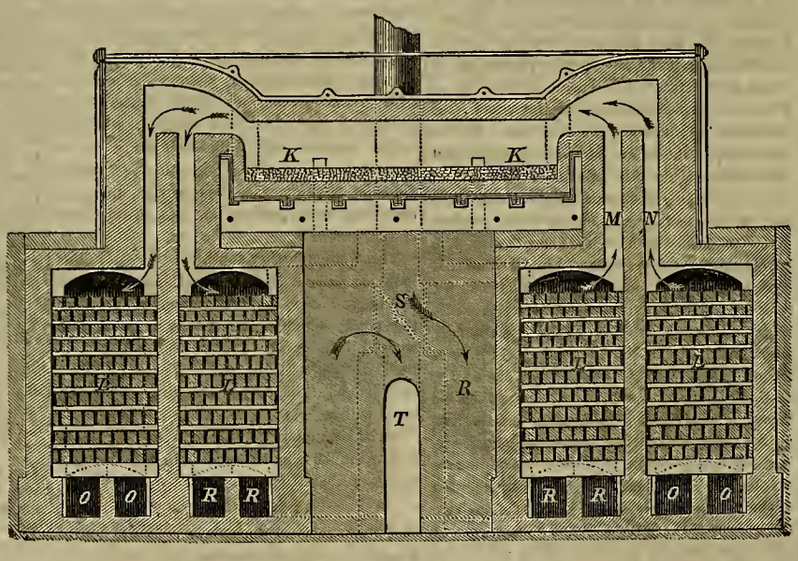
"The gas-producer and furnace are quite distinct, and may he placed at any convenicut distance from each other. The fuel is supplied at intervals of about two hoars through covered openings, and descends gradually on an inclined plan, which is set at an inclination to suit the kind of fael used. The upper portion of the incliae is made solid, being formed of iron plates covered with fire-brick, but the lower portion is an open grate formed of horizontal flat steps. The opening under the lowor step is made larger than the others, to enable clinkers to be withdrawn. The small stoppered holes at the front and at the top of the producer are provided to allow of putting in an iron har occasionslly to break ap the mass of fuel and detach clinkers from the side-walls. Each producer is capable of converting daily about two tons of luel into a combustible gas, which passes off into the main gas flue leading to the farnaces.

"The action of the gas-producer in working is as follows: The fuel descending slowly on the inclined plane becomes heated and parts with its volatile constituents, the hydro-carbon gases, water, ammonia, aad a small proportion of carbonic acid, which are the same as would be evolved from it in a gas retort. There now remains from 60 to 70 per cent of purely carbonaceous matter to be disposed of, which is accomplished by the current of nir slowly entering through the grate, producing regular combustion immediately upoa the grate; but the carbonic acid (an iacnmbustible gas) thus produced having to pass slowly through a layer of incandescent luel from two to three feet thick, takes up another equivalent of carbon, and is thus transformed into carbonic oxyd, which passes off with the other combustible gases to the furnaces. For every cubic foot of carbonic oxyd thus produced, taking the atmosphere to consist of one-fifth part by volums of oxygen and four-fifths of nitrogen, two cubic feet of incombustible nitrogeu pass also through the grate, tendiag greatly to diminish the richness or heating power of the gas. Not all the carbonaceous portion of the fuel is, however, volatilized on such disadvantageous terms; for water is brought to the foot of the grate by a pipe, which, absorbing the spare heat from the fire, is converted into steam, and each cubic foot of steam, in traversing the layer of from two to three feet of incandescent fuel, is decomposed into a mixture consisting of one cubic foot of hydrogen, and nearly an equal volume of carbonic oxyd, with a variable small proportion of carbonic acid. Thus one cubic foot of steam yields as much inflammable gas as five cubic fest of atmospheric air; but this one operation is dependent upon the other, inasmuch as the passage of air through the fire is attended with the generation of heat, whereas the production of the water gases, as well as the evolution of the hydro-carbons, is carried on at the expense of heat. The generation of steam from the water, being dependent on the amount of heat in the fire, regulates itself naturally to the requirements; and the total production of combustible gases varies with the admission of air, and, since the admission of air into the grate depends in its turn upon the withdrawal of the gases evolved in the producer, the production of the combustible gases is entirely regulated by the demand for them.

"The gas made in these producers has been frequently carefully analyzed, and the average constituents of one hundred parts have been found as follows: Carbonic acid, 4·1; oxygen 0·4; carbaaic oxid, 23·7; carbureted hydrogen, 2·2; hydrogen, 8·0; nitrogen, 61.5; total, 99·9.

"The furnaces are applicable for all purposes where intease heat is required, such as for glass-houses, puddling, heating iron and steel, iron melting for foundry purposes, steel melting, muffles, and copper smelting. In all applications the furnaces are of the same construction in principle, the arrangements only varying with the different operations to be carried on in the heating-chamber. The heating-furnace has been selected for illustration. Underneath the heating-chamber, K, are placed transversely the four regeaerators, L, L, L, L, which are chambers filled with fire bricks built up with spaces between them. The regenerators work ia pairs, the two under the right hand end of the furnace communicating with that end of the heatiag-chamber, while the other two communicats with the opposite end. The gas passes from the maia gas flue through the reversing-valve, S, into the flues, R, R, at the bottom of one of the regenerators, L, up through which it passes to the port, M. Air is also admitted through a reversing-valve at the back of S (not shown in the figure), thence into the flues, O, O, up through the second regenerator, L, to the port, N, where it meets with the gas, mingles with it, and produces aa intense and uniform flame, which distributes itself all over the heating-chamber, K. The products of combustion, together with the excess or waste heat of the furnace, instead of being passed, as in ordinary furnaces, up the stack, and either entirely thrown away or only partially utilized, are carried down into the other pair of regenerators, where they are deprived of their heat, and thence proceed through the reversing-valves to the chimney by the flue, T.

"When one pair of regenerators has become considerably heated by the passage of the hot products of combustion for some time, and the opposite pair correspondingly cooled by the upward passage of the cold gas and air, the valves are reversed, and the currents of gas and air then pass upward through the regenerators last heated, whereas the products of combustion pass through those opposite. The process of reversing is repeated at fixed intervals, generally every half hour, so that two of the regenerators are always being cooled by the gas and air taking up the deposited heat and carrying it back to the furnace, and two always being heated by the passage of the hot products of combustion passing down to the chimney and depositing their heat on their way there. The flame in the heating-chamber is uniform throughout, and perfectly free from all extraneous matter. Its chemical nature is also perfectly under command by means of gas and air regulating valves (not shown in the engraving), so that the most delicate operations can be carried on with great uniformity. The gas and air reach the heating-chamber (after passing through the regenerators) at nearly the heat of that chamber itself, and in burning, in addition to the temperature due to their mutual chemical action, is added that they have taken up in passing through the regenerators, so that an intensity of heat is obtained which, unless moderated on purpose, would fuse furnace and all exposed to its action. The products of combustion are so completely deprived of the heat they brought out of the heating-chamber, K, by passing among the regenerator bricks, that the heat in the chimney-flue is seldom sufficient to singe wood; the economy is therefore due to the fact that little or no heat is thrown away up the chimney, as in the ordinary furnaces, and also to the perfect combustion of the fuel, which is evidenced by the total absence of smoke from the stack; whereas in the common furnaces the combustion is so imperfect that clouds of powdered carbon, in the form of smoke, envelop all manufacturing towns, and gases are allowed to escape with two-thirds of their heating power undeveloped. The saving of fuel in these furnaces, as compared to the ordinary kind, ranges between forty and sixty per cent. in weight, according to the fael used. In many instances an additional saving can be made in the cost of the fuel by using inferior qualities, such as coal and coke dust, lignite, and peat. The intensity of the heat, purity of the flame, and the absence of cutting draughts in the heating-chamber, is of great advantage for all metallurgical operations, tending greatly to improve the quality of the produce, and occasioning a saving of about five per cent. in the wasts of the metal treated in puddling and iron re-heating furnaces, etc."



SEIMEN'S HEATING FURNACE.

Prize Medal.—A very interesting ceremony took place at the close of the public examination of the Denman School on Thursday, at which sixteen medals were distributed to the same number of pupils who shall have attained the highest grade of scholarship with perfect deportment throughout the year. These medals are purchased from the annual proceeds of a fund of $1,000 which has been donated for that purpose by Mr. Denman, the Principal of that school. This Medal Fund has been established and will be managed on the same plan as the Franklin School Medal Fund of Boston, Massachusetts. The present was the first distribution of these medals.

The following are the pupils who obtained the medals this year:

Gold medal to Annie Compton, of the Graduating Class. Silver medal to Angie Crary, Bell Baxter and Louise Templeton, of the Graduating Class; Carrie Smith, of the first class; Adelia Curtis, of Miss Keith's class; Sarah D. Everding, of Miss Doud's class; Alexandrina Lyons, of Mrs. Pearson's class; Isabella Vizzard, of Mrs. Clapp's class; Candace Jenner, of Miss Williams' class; Mary E. Donnelly, of Miss Pattee's class; Matilda Clement, of Miss Sherman's class; Emily J. Johnson, of Miss S. Williams' class; Jennie C. Miller, of Mrs. Wood's class; Lelia K. Curtis, of Miss Chadbourne's class; Mary A. Lumsden, of Miss Bowen's class; and Caroline Hogg, of Miss Doud's class.

Dr. C. T. Jackson, of Boston, has been giving the Academy of Sciences in Paris an account of some of his observations in California and Nevada. He says the silver ores of Austin, Nevada, consist in the undecomposed portions of the veins of sulphats of silver and red sulphide of antimony. In decomposed parts of the vein are chloride, iodide and bromide, the latter being formed by double decomposition from the action of external influences. A fragment of the ore thrown into the fire of a blacksmith's forge is at once covered with spangles of reduced silver. At Austin all the veins are quartz ore and imbedded in feldspathic granite. Their thickness varies from a few inches to three feet. He had himself seen the ores yielding $1,300 to the ton, and the average was $200, the cost of extraction being $80 to the ton. The cost is high at Austin, because the ore has to be brought from the mountains a long way off. At Virginia City the ores yield only forty dollars per ton, but as they do not have to be roasted, the cost is less, and they are very profitable. Austin was unknown three years ago.

The Treasure Drift.—The treasure shipment by the steamer of Tuesday last was $1,328,069. The total shipments since the first of January last were $16,431,288; a decrease of $1,012,666, from the shipments during the same period last year.

Communications.

In this Department we invite the free discussion of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

Atlantic Correspondence.

A NEW PROCESS.

Editors Press:—While you of the Pacific coast are diving down deep into the bowels of the earth, to get her hidden treasures, we of the Atlantic coast are devising some means to more easily work them, and my purpose in writing you at this time is to tell you what has been the results of experiments made by a gentleman of this city, in reducing gold, silver and copper ores, but more especially refractory silver and copper ores. Early in the fall of 1865 he came in possession of some argentiferous copper ores from the region of the Colorado River. These ores consist of several metals—gold, silver, copper, arsenic and antimony, held in pure quartz—which class of ores are the most difficult of all known for reduction.

Using the ordinary process, that of amalgamation, he was able to obtain but a small portion of silver; yet the ore assayed as high as $100 to the ton of silver, and contained about eight per cent. of copper. He then, after weighing the usual fluxes with it in crucibles, and obtaining fair results, determined to build a blast furnace, and observe what a very intense heat with certain fluxes would produce; and having studied the construction of furnaces here, erected one of suitable size for working with a hot blast. This was charged with ore, charcoal and fluxes, continuously, similar to a blast furnace for smelting iron, and tapped for slag and metal in the same way, and after a run of two hours the product was a metal resembling the white metal of the Swansea furnances, which is obtained from copper ore run through from reverberatory furnaces, a description of which may be found in Ures' dictionary and many recent works. This metal is separated into silver and copper by well-known processes—the sweating and the Pattison. Believing that by this method he could obtain better results than by any other, and presenting his views to several scientific gentlemen, they all agreed in the opinion that no rules of science were violated, and believed it would work a revolution in the reduction of ores. By this method all the metal is saved, for it is really *an assay by fire* on a large scale. All the materials used are found generally where gold, silver and copper ores are found, and the cost of erecting furnaces and procuring suitable machinery, will be small compared with the cost of work as at present conducted. Ores that contained sulphur to any extent are easily reduced, for the intense heat used and the presence of carbon in the fluxes, sets it free from the silver, so that it may be called a desulphurizing process. It is more certain than an assay, even, for there the sulphur is retained, as there is no blast containing oxygen, thrown in to disengage it. After a careful examination of all authorities, French, German, Spanish and English, the Commissioner of Patents became convinced that the method had never been used, and granted a patent for the same; rights for which are now offered for sale.

With the careful way in which this matter has been tested, we think every intelligent man must be convinced that here is a very great advance made in the separation of precious metals from ores, and one that must soon come into universal use. The sooner those interested in mining take it in hand, the sooner will they reap the benefit of the invention; for with it, all their metals can be saved, while now a large portion is lost. We enclose you a small piece of the metal as it came from the furnace, which contains of copper about 85 per cent. and silver 5 per cent.

Yours, Atlantic.

Buffalo, April 24, 1866.

Remarks.—The above description is not sufficiently detailed to enable us to see precisely upon what grounds this process has been decided new and a patent granted for it. There is certainly nothing new in the *general* metallurgy of the process as above indicated. A similar process has long been used in Europe for concentrating the precious metals from pyritiferous and other ores, so poor in gold and silver that they cannot be worked with profit by the ordinary means. Other methods however, are found to be more economical in Europe for richer ores, and the application of the above process upon a large scale to *ores of this class* may be new.

It is much more properly a *concentrating* than a desulphurizing process. The direct powers of carbon, as a desulphurizing agent, are by no means so great as many suppose, and the action of the oxygen in a blast furnace depends upon very numerous details in the management of the furnace, which without constant and minute attention are liable to vary every hour. Though this process indeed *resembles* the fire assay, it is far from being *identical* with it. In the latter the sulphur, etc., are effectually removed, not by the oxygen of the air, but by the action of the fluxes used.

The claim that "by this method *all* the metal is saved," cannot be true. There is a loss, and one which, with rich ores, is by no means insignificant. Circumstances in this country, however, are very different from what they are in Europe; and it is not unlikely that methods similar to this may be used with great advantage in certain localities, and with certain ores. This is a question which the situation of the mines, the character of the ore, and local circumstances generally must determine.

It would hardly be prudent to invest a large sum, at first, anywhere upon the chances of this with gold and silver ores. Full experiments should first be made upon a smaller scale, and future action be guided by the results of these.

[Written for the Mining and Scientific Press.]

The Trade of the Pacific Islands.

Editors Press:—There is a gentleman at present stopping in this city, who has lately arrived here from the Island of Tahiti. He is interested in a sugar plantation on the island and is intending to take back with him the machinery for a sugar mill, which the Miner's Foundry Co. have just completed, and which he proposes putting up on the plantation in which he is interested, adjacent to the town of Papeete, the principal town on the island. This gentleman is a native of Connecticut. He has resided upon the island for several years past and speaks highly of its climate, the fertility of its soil and the great inducements which there present themselves to enterprising persons. From parties who have conversed with him in reference to these matters, I understand that good lands can be bought there from the natives for about five dollars per acre, the title being protected by the Tahiti government, after thirty days notice of contract of sale is given. The government itself is now buying up these lands as fast as possible *and selling them again at the same price* to actual settlers, or to parties who intend improving them, giving also a long credit, if desired, at a low rate of interest. These lands are especially adapted to the raising of the sugar cane, coffee, rice and cotton of the first quality. The government pay a premium per head on coffee plants and loan money to planters to assist them in developing the resources of the country.

The island of Tabiti, formerly called Otaheite, is one of the Society Islands, being the largest one of the group; it is 108 miles in circumference and consists of two peninsulas, connected by an isthmus submerged at low water, and surrounded by coral reefs. The latitude of Point Venus is 17° 29′ 2″ S. longitude 149° 21′ W. In the north part of the island is a mountain 7,000 high, nearly twice as high as Mount Diablo. In view of the fact that owners of sugar plantations on this island come to San Francisco to get their machinery, is it not encouraging to all who have the welfare of this city at heart? This single fact shows what a great extent of country will eventually enter into commercial arrangements with us. This is but the beginning of a trade which will yet be entered into with hundreds of other islands scattered through the South Pacific. The Feejee Islands, 154 in number, of which, however, only 65 are inhabited, lying between long. 178° W. and 177° E., and between lat. 15° and 19° S., are of course much nearer to Australia than to us; yet, we may reasonably expect, even from the future sugar and cotton plantera of these now cannibal islands, our full share of their trade. The Sandwich Islands are right at our doors, and have just started in a path of enterprise which will, ere long, be of fabulous proportions, and which, combined with our trade with China, Japan and the South Sea islands, will make San Francisco one of the largest and richest cities in the world.

San Francisco, May 29th, 1866.

Observer.

[Written for the Mining and Scientific Press.]

From El Dorado County.

BY OUR TRAVELING CORRESPONDENT.

[Continued from Page 323.]

Messrs. Editors: Having set out on one of April's loveliest mornings from the Nevada Hotel, in El Dorado, not the least flourishing of the mining villages in this part of the country, I reached, after a ride of two miles south, a cluster of very promising little quartz lodes, but all so similar as to dip, size and in almost every other respect, that a description of two of them,

THE EMPIRE AND EL DORADO,

Will be sufficient to give a correct idea of the whole. The former is chiefly owned and has heretofore been worked profitably by Messrs. Burlingham & Goldy of Empire City—the locality of these claims—where they have a 10-stamp mill, pump, and an engine of 15-horse power. Owing to the absence of one of the partners from the State, the mill has for some time lain idle, but will resume operations in June. These gentlemen informed me that they had no refuse rock, the whole thickness of their lode which is about three feet, averaging $12 per ton, none of the rock falling short of $8; assorted, running as high as $100.

THE EL DORADO,

Running parallel with the Empire, belongs exclusively, I believe, to Messrs. Kelsey & McFee. They are working their ore with an arastra, and are getting satisfactory returns, the quartz, like that of the Empire, and other claims of the neighborhood, averaging throughout the whole width of their lode about $12 per ton; some crushings yielding as much as $75. Although the rock of this cluster is not so rich as that sometimes found in what are called "spotted leads," the uniformity in its value, taken in connection with the general diffusion of the metal, gives them a stamp of reliability and permanence not always possessed.

Three miles further south the Long Hollow lode was passed, having something less than 100 tons of good looking rock piled up near the shaft, which, I afterwards learned, had worked from $15 to $25 per ton. The lode was five feet in width, and appeared, though well defined, to be turned somewhat from the usual course.

On this same ridge, one mile further south and about six from El Dorado, in the vicinity of Sugar Loaf Mountain, is

THE HERMITAGE,

Not inappropriately named, as it is situated in a rather secluded spot, surrounded with everything attractive in the form of woodland, wild flowers and mountain scenery. It is owned by Dickermaa & Co., of Boston, and by Messrs. Eddy & Ellen of Diamond Springs, the latter old Californians, and it is entirely under the control of the owners, salaried officers not being deemed indispensable. They recently paid $32,000 for the mine, and have erected hoisting works, driven by a 15-horse engine, with one of Hansbrow's force and lifting pumps attached. Their 20-stamp mill, which is said to be a duplicate of that of the Church Union, already favorably noticed, is now nearly completed and their new 75-horse engine, which is on the ground, will be amply able to propel the twenty additional stamps to be put on the ensuing autumn. At least 3,000 tons of ore, thought to be worth at the lowest calculation $10 per ton, are now awaiting the stamps, from which a yield of from $25,000 to $30,000 is confidently expected—a sum sufficient to meet the whole cost of their entire improvements.

The lode has been opened in five or six different places, showing an average width of about ten feet. The main shaft is down 140 feet, with a drift from the 100-foot level south 75 feet, and another north from the same level 110 feet or thereabouts. Two other shafts have been sunk north of the main works to the depth of ninety feet each. I understood from responsible parties in the neighborhood that not less than $10,000 had been taken out of this mine by former owners, and that with the common pestle and hand mortar.

The present company have had a yield, by mill process, of $11.50 from some of their poorest rock—the amount of gold contained in the sulphurets not included. They have ascertained that a ton of their sulphurets, which about 200 tons of ore are expected to yield, is worth $1,500, an amount in itself not inconsiderable, and when added to the yield in free gold, gives an average equal to the best paying mines of the State. Mr. M. D. King of El Dorado, who kindly accompanied me in his own conveyance, lays claim to the first northern extension of the Hermitage. It has been opened by a shaft and prospects fully as well as the original, some choice specimens yielding $20 per pound, or at the rate of $40,000 per ton. "May he find a few tons of such," is my last and parting wish.

We now turn a little aside to notice

THE WHITEHEAD LEAD,

A claim heretofore inadvertently omitted, situated a mile east of the range last described, and the next north of the Church Union. Jamison & Co. of Empire City, to whom it belongs, are now actively at work upon it, taking out quartz similar to that of the Union, which has paid them as high as $21 per ton, sulphurets not included. Their shaft is sunk twenty-two feet, exhibiting a lode four feet wide of blue quartz, which is worked by an arastra driven by water power, both wood and water being found in abundance and near at hand.

THE DAVIDSON QUARTZ MINE,

Deriving its name from the location and principal owner of the claim, lies about one and a half miles north of El Dorado and consists of 2,700 feet. The main shaft, which has been sunk a little south of the principal chimney, is 105 feet in depth, inclusive of the lower portion which follows the lode on its natural incline to the east. At the 100-foot level it is four or five feet wide, having the usual clay seam or gouge on the foot wall, which is the ordinary black slate of the country. The true vein at this depth was only four inches thick, but some five feet lower, it had widened to at least two feet, and showed what is known here as the ribbon variety of quartz. This portion of the veinstone is not yet so productive as the mass found nearer the surface or immediately adjoining, but is looked upon as more reliable and permanent, the former assaying only $10 to the ton, while the latter, including the poorest quality, worked $13.75. The greater portion of this mass to the depth of sixty feet and covering a broad margin along the chimney is known to be much richer.

Mr. Davidson puts the estimate as high as $25 per ton, which cannot be far from the correct mark, if a judgment could be formed from seeing some half a score of small pieces, taken at random from different points and depths, and prospected with the mortar and pan, every one of which, without exception, showed a large number of exceedingly fine colors, thus determining not only that this large mass contained gold in considerable quantity, but that it was well diffused.

KELLEY CREEK LODE,

Two and a half miles north of Shingle Springs, owned by W. H. Gray and brothers, has an average width of eighteen inches. The rock is worked by a 10-stamp mill, run by a 16-horse engine, with the usual hoisting gear, and has averaged at the rate of $25 per ton throughout the whole thickness of the vein. This estimate does not include some exceedingly rich and handsome specimens of coarse gold, which I had the pleasure of seeing and handling, one of which was worth $300, and another weighing about eight pounds, the largest and richest hitherto seen in my wanderings, was valued at $1,000, or running at the rate of $250,000 per ton. Near the surface the quartz is more or less decomposed and easily worked—the very first ton yielding some $1,500. The rock grows somewhat richer as you approach water level, which is within thirty-six feet of the surface, some of it having paid as high as $5,000 per ton. These gentlemen have recently sunk a shaft to the depth of sixty-five feet, cutting the lode which is here more solid with a larger proportion of sulphurets, but as none of the quartz below water level has as yet been worked, the question as to its continued richness still remains to be determined—the probabilities all in its favor.

Near this lode and running parallel, we also examined a promising claim, known as the Wild Woods, some three feet thick with dip and direction the same as the above, and opened by a shaft seventy-five feet in depth. Two crushings turned out respectively $12 and $16 per ton. The stock is owned by Messrs. Hodgkin, Palmer and others near the mine, and Mr. Kellogg and other citizens of Sacramento.

THE PYRAMID

fs located osar the Rose Spring House, three miles north of Shingle Springs. and seven from Coloma, and is owned exclusively by Wm. E. Gaylord of White Oak township, and Charles E. Abbot of San Francisco. The ledge which crops out in several places in large shoots or chimneys, is well defined by nlmost perpendicnlar walls, being at least seven feet in width at one point where it had been opened by a shaft of thirty feet in depth. It is known to contain fine gold in quantities varying from $5 tn $35 per ton, having worked up to the higher figures here given, the metal being fnund well diffused through the rock, of which there appear to he thousands of tuns thrown up here above the surfaco. It possesses odvantages in point of accessibility and facilities fur working rarely lound, the lode being crossed near the largest chimney by Dry Creek, which has a fall of upwards of fifty feet, and a ditch already constructed which conveys on abundant supply of free water lrom this, and also from Indian Creok but a short distance above. The parties interested in the mine expect soon to avail themselves of the advantages here claimed, and will he able, I trust, in a short time to open up onn of the most valuable, as it now is one of the largest claims in the county.

The next day, a horse having been proffered by Mr. Hodgkin of the Rose Spring House, I set nut ncross the mountains under the guidance of Mr. W. E. Gaylord of the Pyramid, to visit some more of the mines of Pilot Knob district, together with a few not far from the junction of Weaver Creek with ths Amerlcan river. We passed on our way the *Pilot Knob* in the district and near the base of a prominent mountain of the same name, ledge ten feet, direction east and west, dip slightly to the north. I had no difficulty in finding free gold after a little rummging among the rock at the dump. This rock is said to have paid by arastra about $12 per ton.

THE JURGANS MILL AND MINE,

Are situated eight miles northwest from Shingle Springs, and some two miles above the month of Nevada Creek. The lode is well defined, with a narrow clay seam on one wall, with a direction north, and a dip to the west as far as opened, which has been to the depth of ninety-five feet. There nre two other shafts here—one of thirty feet, and the other of fifty-five feet—the average distance of these from each other being about 130 feet, the deepest shaft being at least about thirty feet hslow the bed of the creek. The vein is of a very uniform thickness of about three feet, and pays from wall to wall some twelve dollars to the ton. Mr. Jurgans, the sole owner of the mine, has erected a 10-stamp mill, the stamps about 300 ponnds each, and uses a No. 10 Douglas pump, of dooble stroke, which works well. It has been worked with economy, and under the exclusive control of the proprietor for the last three years, who appears well satisfied with the interest on the investment. Mr. Jurgans was also hauling and crushing about six tons of rock daily from the Blue Bank company's claim, half a mile above, whose rock works from ten to fifteen dollars per ton. Their lode is about four feet in width, and has a dip and direction similar to the above. We must here close our account of the gold-bearing lodes of El Dorado, and devote the remainder of this letter to copper, hy no means the least important interest of the county.

After returning to Shingle Springs I had an invitation from Mr. Davidson, of the toll-gate above the village, to a seat in his buggy for a ride to

THE BOSTON COPPER MINING COMPANY'S CLAIM,

About five miles from Shingle Springs, the same from Latrobe, and one west of the railroad. It consists of 3,000 feet, the stock being held principally in San Francisco. A shaft was at first sunk on the lode 108 feet, striking good copper ore at the depth of fifty feet from the surface, varying from sixteen to eighty per cent., and apparently improving as a greater depth was attained. But instead of following the vein (tempting and promising as it was), for convenience of working and other considerations at the time deemed weighty, the company went sonth of this shaft 225 feet, and lowered another, perpendicularly, to the depth of 140 feet. Drifting west from this 118 feet, and failing to find the lode, they returned to a point thirty-three feet from the foot of the 140-foot shaft, and are now running north along a vein containing more or less copper, with flattering prospects of success, supposed to be now within forty feet of the pay vein (found in the first prospecting shaft), which will be struck at a much greater depth. They have already expended about $30,000 in the search, exhibiting a degree of almost unparalled energy and perseverance, which will, I hope, be eventually rewarded.

Mr. D. McCarty, the present superintendent of the company, profiting by the experience of the past, is pushing forward the work of development with such a well-directed energy that can hardly fail of success, when taken in connection with the copper indications strewn everywhere on the surface, and the yellow sulphurets or pure ore already discovered in different portions of their works. Following the direction of the Buston south, to within two miles of Latrobe, we come upon five or more locations, all more or less developed. First, is the Agra Copper mining company, of 2,200 feet, with two shafts to the depth of twenty-five or thirty feet; second, the Nyman and Douglas, with a shaft of 115 feet sunk east of the vein, to which a drift is now nearly completed from the greatest depth heretofore reached, and from this interesting developments are hourly expected; third, the Bryant, happily located on an unusually large shoot or outcrop; fourth, the Spring elnim, on lower ground than the former, but showing fully as high a grade of ore. The last, but not least, is the Cosumnes Grove, a well-defined vein running from five to eight feet in thickness, with dip east, and course northwest—characteristics of the whole.

The ledge is readily traced for miles by means of frequent outcrops on the surface, and the various marks of copper ore everywhere to be found, which the veriest novice in mineralogy could scarcely fail to observe. Its development is only a question of time.

One mile north of Latrobe, is the claim of

THE TEAR AND RIP COPPER MINING COMPANY,

Consisting of 5,400 feet, and owned principally by parties in San Francisco, who have been for some time pursuing the work of development with only an occasional interval of cessation. Near the surface the vein is somewhat broken up, but contains all the indications of copper, and some ore of low grade. At forty feet it was found in large quantities, and at the depth of seventy-five feet—the greatest attained by the shaft—both the quantity and quality seem to be fast improving, while the lode has become comparatively well-defined, and showing a width in the neighborhood of ten feet.

One hundred feet north is the shaft of

THE RETORN.

This has been sunk to a depth of eighty-five feet, from the foot of which, as I learned, a drift had been run, cutting this same vein, bringing to view equal if not superior ore to any hitherto discovered, all the developments thus far made being encouraging, and all that the most sanguine ought to expect. At these two claims some of the gray copper and also yellow sulphurets were seen, together with some appearance of "mundie and other accompaniments or indications of copper" ores.

Much more might have been said with reference to the copper and other minerals of El Dorado, but we have only space, by way of

CONCLUSION,

To add specially, as to the copper claims in the vicinity of Latrobe, that they evidently lie on a range with some of the best copper mines of Amador; and, generally, as to the mineral resources of the country, that while many facts have been necessarily abbreviated, and others wholly omitted (a long letter from Placerville probably not reaching the office), sufficient have been detailed as to the extent, richness, and permanent character of her mineral lodes to quiet the doubts of the most skeptical and betoken for her a speedy and lasting prosperity, such as has scarcely yet been dreamed of by the most sanguine or visionary.

In this belief, I bid you adieu, till you hear from me elsewhere, as a PROSPECTOR.

Latrobe, May, 1866.

PREMIUM FOR THE DISCOVERY OF WATER ON THE DESERT.—On April 10th, Mr. Rice, of Maine, from the Committeee on Territories, reported back a joint resolution to facilitate communicatinn with the territories of New Mexico, Arizona, and Colorado. The joint resolution provides that whenever any loyal citizen of the United States shall make and establish an artesian well on the line of any mail route in New Mexico, Arizona, Colorado, or the Colorado desert of California, at least ten miles distant from any spring or stream of living water on such route, he shall be entitled to one section of the public lands embracing such well, to be marked out and designated in a compact form.

COMPOSITION OF GAS WITH AIR.—A Mr. Schloesing has recently succeeded in obtaining some remarkable results in the production of exceedingly high temperatures by the combustion of gas with air. By regulating the quantity of hydrogen and air brought together at the time of combustion, a considerable change of temperature can be obtained, the highest named in a communication recently made to the Academie des Sciences of Paris by Sainte-Claire Deville, being 2,736° centigrade. By taking hydrogen obtained by the decomposition of water, and causing it to pass over incandescent charcoal before it arrives at the place of combustion, where it is charged with the requisite quantity of air, a temperature of 2,870° centigrade was obtained. A practical application of this heat is proposed for foundries and workshops.

[Written for the Mining and Scientific Press.]

Hotel Telegraphs—A Suggestion.

MESSRS. EDITORS:—Among the most modern improvements in hotel buildings, are the telegraph and the hoisting or elevating works. I am surprised that people who spend so much money as the hotel proprietors of this city are doing, have not devised either better or more convenient stairs, or introduced the telegraph and elevator improvements of other localities. Where people are always in a hurry, as Californians generally are, it would be a great blessing for hotel boarders to get a speedy and easy communication. All the hotels in England are provided with elevators, constructed on the same principle as the hoisting works in a mine. A platform six or eight feet square, moves in a frame up and down, and guests as well as servants are raised to the upper story in a few seconds. These elevators are moved by steam or water. In the Great Eastern Hotel, London, water pressure from the water-works is used; in other hotels steam power is used.

The next important improvement in Germany is the telegraph. Every room is provided with a telegraph, the same as they are here furnished with a bell. If you wish anything from the office, put your finger on a small silver knob and call for the waiter, the chambermaid, for coffee, tea, wine or water; in fact, anything you wish for can be expressed in a very simple manner. A child seven years old can easily learn it. By the present system, if we wish for anything we have first to ring the bell; then appears the waiter; then we order; then he starts off; and lastly he appears again, after having traveled over one hundred steps or more, and the guest has had the pleasure of waiting all that time for what he desired. Is not this a great waste of time? I hope that some of our hotel-keepers will consider the matter, and have these improvements put in for the comfort of their guests, and for their own economy. If any one wishes further particulars on these improvements, I shall be glad to assist them. Yours, etc.

J. MOSHEIMER.

THE COLLEGE OF CALIFORNIA.—The Commencement exercises of this Institution will be held on Wednesday next, June 6th, at 12 M., in the new College School Hall, at Oakland. After the speaking by the graduating class, the Commencement Oration will be delivered (at about half-past one o'clock) by Rev. Henry M. Scudder, D. D. Subject—"Hindu Philosophy and Boston Transcendentalism." Hon. O. L. Shafter has been selected as the Orator of the Day. His Oration will be pronounced at 3 P. M. The evening, as usual, will be devoted to the alumni supper, with its accompanying "feast of reason and flow of soul." Those who have attended the two last gatherings of the Alumni at Oakland, need not be told of the rare and rational enjoyment which may be expected on this occasion.

SCHOOL EXAMINATIONS.—During the past week the various Public Schools in the city have held their annual examinations, in accordance with the programme in our last issue. More or less extended notices of these interesting exercises are given elsewhere in our columns. The occasion has been one of unusual interest—the schools have all had the fullest opportunity to display their wisdom and beauty; and they have had a lively and happy time in doing so. The Public Schools of San Francisco, take them one and all, in every department and under every circumstance, will not suffer in comparison with those of any city in the Union, or in the world. These exercises have called forth the highest commendations from the large and appreciative attendance with which they have been thronged.

A NEW IDEA.—A writer in the Buffalo *Commercial Advertiser* proposes to increase the freighting capacity of the Erie canal, by building a railroad track on each bank of the canal, so that locomotives instead of horses may be used for towing boats. He says that the average speed of boats moved by horse power through our canals is two and a half miles per hour. If by steam we can double this speed, we can double the amount of freight moved.

THE HIGH SCHOOLS OF SAN FRANCISCO.

The opinion has been expressed by competent and unprejudiced judges, that no private Schools in the Union occupy a higher standard of efficiency than the Boys' and Girls' High Schools, connected with the Public School Department of this city. This fact has been made most prominently apparent during the recent examination in those Schools. The examination just concluded has been more thorough and systematic than on any former similar occasion. A contemporary, speaking of the exercises, says that a graduate of Harvard University, who was present at the boys' examination, expressed the opinion that few graduating classes of that eminent seat of learning would be able to stand the test of an examination in the branches under consideration, to better advantage than did the pupils of the Boys' High School. While the result of the examination in the Girls' High School was no less satisfactory and creditable to the pupils there.

THE GIRLS' HIGH SCHOOL

The public examination of the Girls' School, which is under charge of E. H. Holmes as Principal, took place on Monday, in the presence of a large number of the parents and friends of the pupils, and citizens generally. It was entirely oral, the questions were quite general, and full opportunity given to spectators present to propose additional ones. The answers were generally prompt and correct, and such as exhibited a thorough knowledge of the subjects under consideration. The exercises were interspersed with music and singing. After their conclusion, the Rev. O. C. Wheeler addressed the School with a few exceedingly happy and appropriate remarks.

This School consists at the present time of 97 pupils, divided into three classes—the Senior, Middle, and Junior. The average age of the pupils is sixteen; of the graduating class, eighteen. The commencement exercises of the graduating class took place on Tuesday, at Lincoln Hall.

THE BOYS' HIGH SCHOOL.

The Boys' High School is located at the corner of Clay and Powell streets, and is under the direction of Theodore Bradley, as Principal. The examination of this School for promotions and for graduation, took place last week, and was most thorough and satisfactory in its character.

The annual public examination occurred on Tuesday, and was attended by a large number of the parents and friends of the pupils, and quite a number of prominent citizens and city and county officials. Lectures on chemistry, illustrated by experiments, were given by two of the pupils of the graduating class—masters Lankershow and Felsenthal; a lecture on hydrostatics by master Knowles, on electricity by T. Malloy, on the electric telegraph by Louis Gazynski, on zoology by Charles Foy, etc. In the examination in physiology, the pupils with the aid of a manikin, illustrated the process of circulation, dissected the heart, brain, and other organs, evincing a thorough knowledge of the subject. In the lectures on chemistry, electricity, etc., the pupils showed a readiness and facility in the manipulations of the instruments and a clearness in their illustrations that was truly surprising in scholars of their age.

The Boys' High School numbers between 60 and 70 scholars, whose average age is 15 years. Heretofore there have been four classes, the course of study comprising four years, but by a recent enactment of the Board of Education the course is to be henceforth reduced to three years, with a two years' course for those who only desire to obtain a practical business education.

THE ANNUAL EXAMINATION OF THE CITY FEMALE SEMINARY.—The annual examination of the pupils in attendance upon the City Female Seminary took place on Tuesday, Wednesday and Thursday. The exercises were of a most pleasing and interesting character, and were witnessed by great numbers of the parents, and by the friends of education generally. The school is located at the corner of Mason and O'Farrel streets, and is under the direction of Professor Clarke.

From the Stock Circular ofAssociated Brokers of the S. F. Stock & Exchange Board.

SAN FRANCISCO, SATURDAY MORNING, June 2, 1866.

The amount of capital offering for loan purposes shows no abatement, amply supplying the wants of all classes who can furnish the requisite security. A fair demand prevails in bank circles where the rate rules as formerly—1@1¼ ₱ cent. per month. The outside requirement upon mining stocks and other collaterals is more active, but the former security being in rather less favor, borrowers are effecting loans with more difficulty than for some time past.

The receipts of treasure from the interior mining districts since Saturday last amounted to $1,100,000, and the aggregate for the month of June exceeded $4,000,000. The bullion yield of Nevada and portions of the North coast has fallen off a little recently, but this deficiency is fully made up by increased receipts from the quartz mines of this State.

Legal Tender Notes have been actively dealt in this week, and the par value of the sales exceeded $125,000, receding from 75¾ to 72¼c., seller 30, rallying to 74, and closing at about 75c. bid, 75½c. asked. Small sales of June 7-30's were made at 77½, closing at 79 asked. The latest reliable advices from New York quote gold at 138 on the 31st ult.

City Shares, Bonds, etc., have not fluctuated materially, and are not freely offered. National Insurance was sold at $81 per share; Spring Valley Water at $69; North Beach and Mission Railroad advanced to $55 per share, and Omnibus is now held at $59. Interior County Bonds are attracting some attention, and are held with rather more firmness.

The Mining Share Market has not exhibited much vitality this week, and prices at the close fell to the lowest point reached for a a long time past. Considerable hypothecated stock has been sold lately to cover advances, and is now probably in the hands of stronger holders. Present developments in portions of the Comstock lode, together with the undiminished yield of a number of claims, would seem to warrant present prices, if not to justify the expectation of higher market values.

Crown Point rose to $1,050, receded to $1,000, and then sold at $1,005@1,000 During the week ending 26th ult., 594 tons 2d class, and 55 tons 1st class ore were extracted from the mine. The latter is taken mainly from the winze sunk below the 300-foot level, at a point within 60 feet of the north line. No other new developments have been made lately. The shaft is now down 420 feet, and a station is being prepared for the new or 4th level. Receipts of bullion for the month of May will approximate $110,000, and the regular dividend will be declared on the 9th inst., leaving a large surplus in the treasury of the company.

Savage declined to $835, rose to $926, buyer 30, then sold at $882, and closes at $800 bid. Advices from this mine continue favorable, and the ore product is averaging 80 to 90 tons per day. The present yield of the lower or 6th level is expected to be steadily maintained for some time hence, and an increased production is anticipated from the upper levels. The old shaft is down 60 feet from the lower level, and in drifting north (from the 6th) some 30 feet, a seam of ore has been met with. A further continuation of this drift will, it is thought, reach the body of ore found in the Gould & Curry.

In the Curtis shaft, good progress is being made with the two southern compartments. A drift has been commenced at a point corresponding in level with the 7th station, old shaft, and is now in 25 feet. This is to reach the vein near the Hale & Norcross line, and about 70 feet above their 700-foot level. Receipts of bullion for the month of May amounted to $115,000.

Hale & Norcross has been well sustained at $975@965, and closing at $960. There is a new feature in this mine—the different floors north and south (from the 7th level) still present a flattering appearance, and certain portions are producing a better quality of ore. The yield of bullion for May will amount to some $65,000, and the usual dividend will be declared next week.

Gould & Curry was dealt in at $730, cash, $750, buyer 30, closing at $710 bid. There are still 50 feet of the south drift (from the south branch, 2d station) to clean up before the face can be reached. The east drift from the south branch (2d station) is still in quartz. The ore chambers above continue to hold out well, and a large quantity of ore is being piled up at the mill. Receipts of bullion for the past month amounted to $160,000, and the company have now at their credit a balance of $107,000, with no liabilities.

Yellow Jacket rose from $600, seller 30, to $690, buyer 30, receded to $621, and sold yesterday at $585@525. We have no official advices from this claim this week, but are informed that there is no improvement to note in the quality of ore extracted recently, most of it being of low grade.

Ophir has been dealt in to the extent of some 400 feet, advancing from $385 to $425, buyer 30, dropping steadily to 280, and then closing at $300. We can learn of no favorable feature as to the present appearance of the lower level, and the body of ore in the 6th is said to be "*fair* but *base*," meaning probably not as intrinsically good as it would seem to be, or, in other words, unreliable. Receipts of bullion during the past month amounted to $84,000.

Chollar-Potosi fell from $300 to $295, rose to $330, fell to $290, and sold yesterday at $270@165, closing at $185. The upper stope of the Bajazet ground is said to be looking well, and discloses a large body of ore. In drifting 18 feet east from the New Santa Fe station a little ore has been found, and the Belvidere mine continues to yield some 25 tons of good ore daily. The new station drift (from the shaft) is in about 430 feet, "the end having passed through a soft mixture of porphyry and clay." During the week ending May 26th, 693 tons of ore were sent to custom mills. This company have now a supply on hand of some $20,000, all liabilities being paid.

Belcher rose from 200 to 230, fell to 165, and closed at $130. Within this range 140 feet were sold. Alpha reached from $320 to $290, and closes at $250 asked. Empire Mill and Mining was sold at $160, seller 30, but is now well held at about $165 per share.

Imperial has been held to within a range of $120@92½, closing at $92 bid. Receipts of bullion for the first three weeks of May amounted to $39,200. The damage done to the dam at the Rock Point mill is being repaired at a cost of some $4,000.

Overman has been very active, and nearly 1,200 shares were sold, dropping to $25, rallying to 41, falling to 23, and selling yesterday at $23@24. Bullion has been dealt in within a range of $86 cash, and $60, seller 30, closing at $49. Confidence was sold at 33@30, Exchequer 10@8, and Sierra Nevada at 5¾@5.

The total recorded sales of Stocks, Legal Tender Notes and Bonds, since Saturday last, amounted to $724,591.

Rheumatism ! !

READ IT! READ IT!!

SACRAMENTO, April 16th, 1866.

H. BOWMAN—DEAR SIR: THIS IS THE FIRST WRITing I have done in two years, and it affords me great pleasure to be able to use my pen in the service of those who are suffering, as I have suffered, by stating the following facts:

I have for two years and upwards been afflicted with CHRONIC RHEUMATISM, and until a few weeks ago I have never found anything that afforded me any relief. For three months of the time I was unable to feed myself, and for the last five months my arms have been so bent that I have not been able to dress myself. I was five months at the Warm Springs, at San Luis Obispo, and three months at a Hydropathic Institute in Stockton, and I have been under the care of six different physicians, in the vain hope of relief. About four weeks ago I was induced by a person who had been cured by it to try a bottle of RICHARD'S REMEDY FOR RHEUMATISM, and in less than twelve hours I experienced great relief. In a few days I was enabled to straighten out my arms, and I have been getting better and gaining in strength and flesh ever since. I have now the complete use of all my limbs, and, for the first time in two years, I am out of pain. I do feel for those who suffer as I have suffered, and if they will take my advice, they will lose no time in giving the REMEDY a trial.

Yours truly, GEORGE TAYLOR.

☞ RICHARDS' REMEDY is for sale by

H. BOWMAN,
Druggist, Sacramento.

Price, $2 50 per Bottle. 20v12

The Great Pain Annihilator.

DR. E R JOHNSON WILL WARRANT TO CURE ALL cases of Asthma, Fever and Ague, Catarrh, Sore Throat, and Womb Diseases. The Doctor's success is miraculous in cases of RHEUMATISM, NEURALGIA, CONSUMPTION, GOUT, PARALYSIS, INFLAMMATION OF THE EYES, and all other diseases that human skill can reach. Rheumatic Pains removed in five minutes. Some of the afflicted that visit him come from one to six hundred miles, and soon find relief. Persons at a distance can be cured at home by addressing a letter to Dr. Johnson, No. 700 Market Street, San Francisco, stating case, symptoms, length of time the disease has continued, and have medicine promptly forwarded to any part of the country, with full and plain directions. ☞—Consultation by letter or otherwise, FREE. 16v12-1m

Mining Summary.

CALIFORNIA.

Alpine County—

The Monitor *Gazette* of May 26th, says:

Mr. J. L. French, negotiated with the Mullan G. & S. M. Co. for one hundred tons of ore to be taken from the level now opened by their tunnel. Mr. F. has secured the Pioneer mill and will commence working the ors next week. The ore is from near the surface. The Company will continue the shaft, having nothing to do with taking out the ore. The *Gazette* says, of the "blue sulphuret ore" from this claim: The matrix, or gangue, is a decomposed quartz, and several veins from one to three inches thick run through the other vein-rock of the Mullan lode. The sample before us assays over ninety dollars in silver and gold to the ton.

Amador County—

The *Dispatch* of May 26th, has thess items:

In Vaughan & Co's claim, on the Soroeco lode, rock hes heen struck that will pay $50 per ton by the ordinary working proeess. The vein of quartz is full four feet thick, and so far as prospected, all between the walls will pay the above average....The Potosi claim, located at Drytown, and owned by Messrs. Hickson & Miller, will undoubtedly prove to be the richest strike ever mede in the county. The ledge in the shaft now being sunk is near four feet thick between the walls, and will pay not less than $100 per ton by the milling process. We learn that free gold is visible to the naked eye in nearly every piece of rock in the dump pile. The company are makiug arrangements to build a new mill, to be run by water power, the presnt summer. [Since the above was in type, we learn that this claim has been sold to a San Franeiseo company for $60,000.]....The Drytown or "Seaton lode" is paying well, and will soon commence crushing eome very rich rock taken from their new shaft....Kinsmill & Co., of Fiddletown, at the depth of a hundred feet, have struck gravel in the bottom of their shaft, whieh is located in the hill in the rear of the town, which prospscts from five cents to a bit to the pan. The company will erect arastras in a few weeks for the purpose of grinding and washing the dirt. It being cement, this process is considered absolutely necessary to success in working the elaim.

Correspondence of same paper, from Volcano, says:

The Golden Gate lead is improving in richness as they advanee into the hill. They ere taking very rich rock out of the Pinneer lead. The Vaughn lead is in good eondition. Fogus Co. are working the old Sorocco lead and getting good pay. The Confidenee lead pays $3 per ton for the rock as taken out. Barron & Co. are produeing good rock. Tulloek & Co. will commenee work on the Wide West immediately. Teeples & Co. are about to commenee hauling roek to the mill for crushing. McGhee & Anderson have discovered a rieh lead. They have a shaft sunk twenty feet. Placer miners are doing well. There are some claims on Voleano Flat paying as high as $25 per day to the hand. Philbrook & Co. have struek rich pay dirt in the new tunnel they are running.

From the *Ledger* we learn:

The Spanieh lode, about two miles eouth of town, was sold last Saturday to Messrs Fenton, Jenks & Goddard, for six thousaud dollars. A mill is to be erected....A new discovery, called the 'Vatiean,' has heen made about one mile and a half above Amador City, on Amador creek. The rock, so far as unearthed, is pronounced hy judges to be of superior quality....A few days since the owners of the old Hinkson claim struck unprecedented rich rock—so rich that pure gold can be seen in every piece of rock taken out, and some of it, after being broken with a hammer, is held together hy streaks of gold....The result of the late clean-up of one hundred tons of rock from the Kennedy claim, crushed in the Coney mill, was $4,400.

Calaveras County—

The *Courier* says: "Numbers of rich leads have been discovered during the past winter, and there are now more men employed in the district than ever before at one time. The custom mills are all crowded, and there is now more rock out than they can possibly crush during the season....The lead in the new shaft of the Kentucky company is said to be improving in quality as the miners go down on it....The total amount of ore shipments from the Union mine for the six days ending May 17th, was 1,053,135 pounds, equal to 526 tons, 1135 pounds....A gold-bearing lead, said to be 40 feet wide, has secently heen discovered near the Big Reservoir. The rock is partially decomposed, and is believed to be rich."....The *Chronicle* says: "Quartz mining and prospecting still seem to be on the increase. We have heard of several new discoveries being made within the last week, upon most of which men are already at work....The Sulphuret lead, located in Dutchman's Gulch, is being systematically and rapidly developed. A large number of men are employed in this mine, and it is the intention of the company to erect a mill the present season."....The San Andreas *Register* says: "There are several placer claims near San Antonio Camp in this county, which are paying very good wages. Frank Caneo & Co. have a very good elaim about a quarter of a mile above, on whieh they have sunk a shaft 90 feet, and found pay dirt nearly all the way down. They are now drifting et the bottom of the shaft. In the first two days' work in the drilt they took out 4 oz. and $5."

Humboldt County—

The *Times* correspondent writes from Mattole—"The North Fork well has temporarily snspended the drilling. Prospects were good—drift reached 250½ feet—quantity of oil increasing. Water power is to be applied.... Depth reached in the Irwin, Davis, 730 feet. ....The engine at the Jeffrey well is at work. The Allen & Sutter eompany at McNutt's Guleh, expect to commenee work soon.... The Yosemite is down 200 feet, with an increased quantity of gas."

Lake County—

The Clear Lake *Times* reports the discovery in that county of an immense deposit of volcanic sulphur. A eompany are sending up machinery for their elaims, below Lakeport, and will soon be prepared to turn out a refined article of that mineral....A correspondent of that paper writes: "I have about one pound of pure alum, beautifully crystallized, obtained from the imperfect washing of six or seven pounds of aluminous clay, whieh was taken from the Kelsey Creek alum bank. The hank is most favorably located for working."

Mariposa County—

The *Free Press* of May 26th, says: Green, Snediker & Co., are down in their shaft over one hundred feet. The ore is improving in quality. The vein is situated near Herron's ranch, and is known as the Green Dozier eopper vein.

Nevada County—

The *Gazette* has these items: Three tunnels have been run at the Eureka mine; one of 30 feet, one of 100 feet and one of 75 feet. From the last mentioned, whieh is several hundred feet lower on the ledge than the others, very rieh rock is now being teken. An offer of $50,000 for the claim on Tuesday of last week, was rejected....We are informed that very rich roek was struck in the Federal Loan quertz ledge yesterday. This ledge is situated in the Leeompton distriet, a mile and a half above the Orieutal mill....Five hundred and ten kegs of powder were used in a single blast the other day, at the hydraulie claims of the American eompany, on Manzanita Hill, near North San Juan. Most of the population of San Juan went out to witness it. The *Gazette* says: It made but little noise, and at a distance of three or four hundred yards, where the spectators stood, there was hut a slight jar; hut the entire hill, a hundred and fifty feet in depth, two hundred feet in width, and for a distance back of about three hundred feet, wes lifted eeveral feet in the air, when it settled down, heing thoroughly shaken, and prepared for hydraulicing....The large 30-stamp mill, whieh is now being erected at the Ophir mine, will he completed about the middle of June....A number of miners from Little York township were in Nevada yesterday, to take steps to prevent the railroad eompany aequiring a title to their claims.... Buchmau & Curran, owners of a hill elaim between Little York and Steep Hollow, have been running a tunnel for some months, and on Friday last they struck the blue lead.

The *National* says: Rock which assays $100 to the ton has heen taken from a depth of thirty feet in the Stockton or Lowery ledge, nine miles below Grass Valley....B. L. Lamarque has commeneed suit to recover eight claims, each sixty feet square, in the center of Lafayette Hill, which is now being worked by the North Star company....The Ione mine still continues to yield handsomely to its owners, Sam. Curtis, and others. In a nine days run, with a 10-stamp mill, over nine thousand dollars was taken out, a few days ago....The Fenian company is driving their tunnel with much energy....T. A. Sullivan has resumed work on the Independent ledge, which he prospected in 1854. It is three and a half miles from Eureka....The Moniqua ledge, near Rough and Ready, the above place, promises to he a rich one. The company are now down on the ledge only six feet and have taken out about two tons of rock, which has been crushed at the mill of the Smith brothers, near Rough and Ready. The two tons realized forty dollars....The Manzanita claim, near Nevada, says the *Union*, is cleaniug up at the rate of $1,200 per week. It was the first quartz claim worked in that vicinity.

Excelsior.—The new enow was two feet deep, making a total depth last Sunday, between five and six feet....Meadow Lake is crowded with people. The hotels are all full, and several more are being erected. Many have left disgusted, not with the mines, but with the snow—says the *Gazette*....Same paper says: The first suit from Meadow Lake township was eommenced in the Distriet Court yesterday. It was eommeneed by Thomas A. Hall against P. D. Brownell and the Mohawk and Montreal gold and silver mining eompany. ....A eorrespondent of the San Francisco *Bulletin*, writing from Meadow Lake, May 26th, says: The snow is still some three and a half feet in depth....None of the mills whieh are here at present are running, and from this fact many injurious reports have heen circulated regarding the distriet.

Placer County—

The *Stars and Stripes* of May 23d has these items:

The proprietors of the Baker & Crosby mine, otherwise known as the Banker mine, at Whisky Diggings, are about putting up a dozen of Baux & Guiod's pans. By the proeess whieh they have heretofore used they ohtained only $6 or $7 per ton from the ore; while Baux & Guiod's pans produce $36 per ton from the same rock....Mr. Wahlgren and partner, who took out $1,400 in a few hours, last week, were notified by Daniel Chonte, of Ophir, that he elaimed the ledge, and that they must desist from working it. A lawsuit will probably ensue....The Wells Co. are down forty feet. Five tons of the rock are heing crushed at the Gold Hill mill, as a test.

Plumas County—

From the Quincy *Union* we clip tho following:

The elaims of Gentry & Co., directly below the town of Poorman's, are held at $1,500 per shere....Moore & Co. have had good pay for the last few weeks in their tunnel claims, having worked past the "eave" which prevented working the elaims to a good advantage....Alex. Turner & Co., on the North Fork, struck gravel in their tunnel two weeks ago; since then they have made from $12 to $15 per day to the hand....Thomas Nohrmen and Cox & Co. have good claims at the upper end of Big Flat, and are making from $8 to $10 per day to the haud....The North Star Co. have driven their tunnel in 200 feet. They expect, from the appearanee of the rock in the tunnel, to strike gravel again within eighty feet....Allen & Co. and Reed & Co., at Franklin Hill, are piping out $6 per day to the hand....Baker & Co.'s tunnel is at present 1,100 feet long, and is supposed to be within 100 feet of the channel....The mines at Little Grass Valley seem at present to be a failure. ....The Premium ledge, at Indian Valley, is being worked with great activity. Five or six teams are constantly employed hauling quartz from this mine to the Crescent Mills, averaging about 30 tons per day. The last run on this rock paid over $17 to the ton.... The Plumas ledge seems to be a perfect mass of quartz, no walls having yet been found, and has already a width of 30 feet. This rock pays about $16 to the ton....Some fine looking ore is now being taken from the Prince copper ledge.

Correspondent of same paper from Mineral Township, May 20th, says:

Some few hydraulic claims have commeneed to clean up with flattering prospects. A. Droge & Co., on Rush Creek Flat, eleaned up for two month's work of two men, $1,300. Charley Ketcher is making in his claim half an ounce per day. Jim Smith and Reddy and several other companies are getting into the bed of the creek once more, and are making from seven to eight dollars per day.

J. A. Jacks & Co., one mile below Spanish Ranch, have struck pay in their drilting diggings and have got as high as $3.50 to the pan. So eays the Marysville *Appeal.*

Sierra County—

The *Messenger* of May 26, says the Holmes tunnel is now in 200 feet....An amicable arrangement has been effected between the Richardson and Buffalo companies, at Fir Cap Hill. At the last meeting they consolidated under the name of "Shamrock M. Co." with the determination to proseente work vigorously.

Correspondence of same, from Alleghany, May 20th, says:

The Union still takee the lead on this side of the ridge, crushing its many tons of fine rock every day. They are about to sink a shaft or incline, so as to work to greater advantage....The companies on each side of the Union are also opening rich seams of dark looking quartz, impregnated with iron, sulphurets and plenty of glittering ore....The Fremont Co., located above, is doing a handsome thing in gravel, while the old Pacific has been *reconstructed* and is again ready for active operations upon its gravel deposits....The Ditto, Fac-Simile, and other ledges located in this ravine, are being thoroughly developed.

South Fork correspondent of same paper says that Louis Bernhardt, of New York Flat, has his extensive hank claims in successful operation.

Tulare County—

The Havilah correspondent of the Visalia *Delta*, May 13th, says: "The prospecting excitement still runs high, and several of the lucky ones have made profitable sales. All we lack here is capital. Enough of first class lodes have been discovered within a radius of twenty miles to employ profitably millions of capital. I have made a trip to the Piute district, and as far as I can judge it is immensely rich. Over one hundred leads have already deen discovered."

The Mariposa *Gazette* says: "We received a eall the other dey from W. M. Rains, formerly of Mariposa, but now residing at Hevilah, in the new county of Kern. He rsports that the Clear Creek country is flourishing—plenty of work and lively times. A number of new and rich leads have been struck quite recently, and the country is being rapidly developed.

Tuolumne County—

The *Courier* of May 26th, says: The Junction Company on Wood's creek, are making good wages working ground supposed to be worthless. There are many other places around there that would pay equally as well if worked in the same manner.

Yuba County—

The Marysville *Appeal* of May 24th, says: We understand that there is considerable excitement at Brown's Valley, in consequences of the rich rock struek in the Pennsylvania claim, and the resumption of work on the Yuha. Many of the city lots which have been allowed to go to the common, have heen re-elaimed, and are being re-fenced....The Jefferson pay streak has finally heen reached in the Pennsylvania shaft. The ledge is five feet in thickness, and daily increasing. The quartz is rich....They intend to put up again their machinery in the Daniel Webster, and resume work within a few days. They own 3,600 feet of ground, whieh is divided into 2,000 shares. ....The Yuba Company settled up their money matters to-day, and work will be rssumed without delay....The Donnebroge got rid this week of their water, and good quartz will now be taken out....They are still persevering with the Sweet Vengeance....The Jefferson has thousands of tons of good rock, and even some very rieh quartz in sight.

NEVADA.

Virginia—

The Gold Hill *News* reports a strike of very rich silver ore in the Crown Point mine at that pleee. One speeimen is deserihed as weighing thirty pounds, which had in the center an elegant crystallized eave, the size of a large tea cup, across the outer edges of whieh were several thick strands of silver wire, gold spengled and bright speeks of pure silver, beside one or two bunches of tangled wire silver. Of another speeimen the *News* says: "The largest and, proportionate to its size, the richest mass of silver ore ever taken out of any eilver mine here, was brought to the surface at about four o'clock yeaterday afternoon, teken out of the same 'drift.' Its weight is about 500 pounds. It consists entirely of black silver sulphurets. An assay showed a yield at the rate of $3,000 per ton."

The *Enterprise* speaks of a 302 ounce hriek from the McGregor ledge, Clan Alpine distriet, owned hy a New York eompany.

Dayton—

The Lyon County *Sentinel* of May 26th, saye the Dayton Tailings Company have now on hand upward of 80,000 tons of tailings, making an average of 400 tons ae the accumulation of every 24 hours. The company has contracted to furnish Ruggles, Helm & Co. 100,000 tons at one dollar per ton....The Piute claim, near Mason's ranch, has been worked steadily all the winter and spring hy its proprietors. They have a shaft down 160 feet, with such developments as in their opinion warrant the ereeting of reduction works. We understand they have found very rich ore. It is expected that the furnace will be in operation in a few days.

Reese River—

From the *Reveille* we gather the following: The sale of first class mining property, known as the La Plata Silver Mining company, comprising four parallel veins, named the Fairmount, Bigler, and Twin Ophirs, Nos. 1 and 2, situated in the North Twin River Mining district, has been consummated for the eum of $90,000 in gold coin....Dr. Blatchly hae returned from the Battle Mountain copper mines. They are 100 miles north of Austin....The property of the La Plata Silver Mining company embraces four ledges, known as the Fairmount, Bigler, and Twin Ophirs Nos. 1 and 2, containing in the aggregate 6,800 feet, beside 800 acres of woodland, upon which there are excellent mill sites within a short distance of the mines.

A hrick worth $227.56 was the product of 1,450 pounds of ore from the Collax ledge, South Bend company. The owners have beeu trying to sell the mine at the East, but failing, concluded to work it themselves. This hrick

was the first fruit....We learn from Nelson Brobant that preparations are being made for the erection of another mill at Kingston.... The Booth Brothers have returned from a visit to New York. They will proceed immediately to develop their prospecting in North Twin River district. They are the owners of the well-known Buckeye mine....We saw today about an ounce of cream-colored quartz from the Gold Belt series, crushed in a mortar and then washed in clear water, showing from twenty to twenty-five cents of fine gold.

The Nye County *News* has these items: The Great Eastern is destined to become one of the most valuable pieces of property in the State, and owing to the immense size of the ledge, and facilities for working, is not surpassed by any claim yet discovered—not even the famous Murphy, of Twin River....The Knickerbocker mill is nearly completed, and could, in a case of necessity, be made ready for operations in a few days.....Correspondence of the *News* from Western, Mammoth district, says the main shaft in the Vigilante mine is down 80 feet. Besides this, they have opened their lode in numerous places, for a distance of 800 feet along its length. At many of the openings the ore is remarkably rich and pure, working very uniformly from $250 to $280 per ton.....Same, speaking of the Northern Light: The lode has from three to five feet of pay ore, and has worked right through $79 per ton. From the prospecting shaft (about four and a half by six feet wide, and 115 feet deep), over 70 tons of very rich ore have been taken out, and now lies upon the dump.

Esmeralda--

The *Union* of May 26th, has the following: Kearsarge, so little known throughout California, is just emerging into light. Capt. Paul, who has labored so diligently against many adverse circumstances, has at last commenced crushing ore from the Kearsarge district. Some of the same rock was crushed at Gold Hill, yielding over one thousand dollars per ton, by the mill process. Three other mills will soon be in operation, viz: The Kearsarge, Dayton and Dorr's mill...." The Philadelphia Silver Mining Company, of Nevada" is the new mining corporation which has gone to work to develop the mines in the Discovery tunnel. The company was organized some time since in Philadelphia, and is composed, we are informed, of capitalists who have abundant means....Correspondent of same paper, writing from Partzwick, Mono county, says: As to the success of our mines there can no longer be a doubt....From 2,900 pounds of ore, taken from the Elmira and Crocker lodes 262 pounds of bullion were obtained, each pound of which being worth $3.44, prove the hidden wealth of our hills.

Pahranagat--

The *Reveille* has seen a letter from W. T. Nichols, in which he speaks quite encouragingly of the mines, and says that a Mr. Hodges from Los Angeles, and Mr. Dahlgren from New York, have arrived in the district with materials for erecting two smelting furnaces, which they have already commenced putting up. They brought also complete stocks of mining tools, and they intend prosecuting work at their mine immediately....Governor Blasdell and a portion of his party arrived there on the 11th inst. They had traveled on foot 150 miles, and were pretty well used up—the governor looking worn and jaded. The party had divided and traveled for Pahranagat by different routes, the second of which has not yet been heard from.

OREGON.

The Jacksonville *Times* says that a quartz lead has been discovered in Lightning Gulch, Josephine Co., from which $5,400 was taken out in two hours. The contents of one pan was $2.000. The name of the discoverer is Malichi.

IDAHO.

Albert D. Richardson, the thirtieth of whose letters the New York *Tribune* has just been published, gives the following account of the difficulty between the "Poorman" and "Hays & Ray" companies:

The Hays & Ray lode, as claimed and staked in August last, was 1,600 feet long. A month later, other parties claimed and staked for 1,400 feet a lode which they called the Poorman, crossing the Hays & Ray near the middle, at an acute angle, the two lines of stakes exactly representing the letter X. The Poorman began to work their alleged lode, not at either end, but at the very point of crossing the Hays & Ray, and there struck a pocket or chimney of ore of unprecedented richness—indeed almost pure silver. Portions of this ore actually yielded by the mill process 50 to 60 per cent of silver—a result never before equaled in mining history, and giving rise to the report that Idaho miners had found the silver in 'chunks' as large as candle boxes. It is claimed that they took out $250,000 in two weeks. They certainly harvested large quantities of ore, and carried it away by night on the back of mules, over the mountains, to be crushed in Portland, Oregon. Probably it is the first silver ore ever discovered which would pay to steal or carry away 500 miles in a crude state. The Hays & Ray claimed that the Poorman Ledge did not exist, but that the adverse party were taking out and reducing their ore. The 'Poorman' not only denied this, but with an armed force drove off the Hays & Ray workmen from a portion of the ledge, and threatened bloody warfare unless they could have their 'rights.' After long investigation Judge Myron Kelly of the United States District Court granted an injunction restraining the Poorman party from taking any more ore at present, ordering both contestants to sink shafts and trace their lodes to the disputed point, that a jury might determine which actually owned the ground. This decision, obviously just and equitable, caused intense indignation among the disconfited suitors. It was even threatened to tar and feather the Judge, and a strong attempt is being made for his removal.

The Red Bluff *Independent* of May 23d, says that the amount of freight shipped within the past week for Owyhee, including that now ready to start, is 274,000 pounds. The freight money alone, at eleven cents per pound, would be $32,340. Teams carrying six to eight thousand pounds are constantly running....The mail stages will commence running on the first of July.

COLORADO.

The *Journal* of May 8th, has these items:

Large Yield.—Mr. Nash, of Russel Gulch, cleaned up last Friday from three-fifths of a cord of ore from the Amberg lode, $171.50, at the rate of about $420 per cord....Alfred Papin, at an average depth of 25 feet, has uncovered a two foot and a half crevice of argentiferous ore on Nos. 3 and 5 east, on the French lode, situate in Russell district....In sinking a coal shaft at Atchinson, they have discovered enormous quantities of the finest yellow ochre. The shaft has been sunk to a depth of 260 feet, going through two thin veins of coal. They expect to strike a six foot vein within the next 50 feet....Mr. Tyrer, of Spring Gulch, Clear Creek county, reports mining looking up in that section, considerable prospecting being done, and new discoveries of lodes being made....Mr. C. S. Stowell, of South Boulder, has just returned from Boston, where he has organized a company with a paid in capital of $50.000, for operating in Argentine district, developing lodes discovered last summer, and exploring for more. Mr. Stowell will commence work as soon as the weather will permit....The Fort Scott *Press* says, in the process of boring for oil in that vicinity by the Fort Scott Oil Co., they discovered at the depth of 400 feet a vein of coal eight feet in thickness. The company are still boring for oil, with every prospect of success....The *Register* gives the yield of ten cords Narragansett Company's Gregory ore—193½ oz. of gold. According to the tests by assay, this was only about 60 per cent. of the bullion in the ore....The Narragansett Company retorted 122 ounces from five days' run of a part of their mill, yesterday....Mr. Fitzpatrick, of the Gunnell Company, made his usual shipment, being a handsome retort weighing 142 ounces. ....The First National Mining Company put in an appearance yesterday evening with 57 oz. 18 pennyweights....Mr. Cameron, gulch mining on Clear creek below Black Hawk, is taking out on the average, about eight dollars per day to the hand....Lyon's last shipment of bullion weighed 52½ pounds Troy, 23⅓ parts being gold. The above amount was taken from Gregory ore, on which one furnace was employed nearly two weeks.

ARIZONA.

The *Miner* of May 9th, says the feeling there is now largely in favor of gold quartz; the working of it being so much simpler and cheaper than that of silver ore.....Jack Swilling was to leave the Pima Villages on the first of June, with his prospecting party for the White Mountain region....Two hundred dollars a ton was the yield at a late clean-up of rock, not assorted, from the Accidental vein....A portion of the timber for the Wunderlich & Borger mill has been taken from Prescott to Big Bug. It is not yet known when the mill will arrive....The *Miner* has seen some of the (placer) gold taken out by the Excelsior company, on lower Lynx Creek, and speaks favorably of its prospects....A part of one of the Thunderbolt company's mills had arrived at Prescott. The balance was expected within the month. It is to be driven by a "Little Giant" engine.

The *Alta*'s Arizona correspondent under date April 3d, has the following items:

The Moss lead is being rapidly developed. ....The Michigan and Parsons are being worked by Mr. Hardy, with flattering prospects.....Horn silver is abundant in the croppings of the Dayton....The further development of the Leland will commence immediately, a supply of powder, etc., having been received. ....At the Techatticup, in El Dorado Cañon, ore was being taken out worth $60 per ton; some had yielded $90 to the ton....Several lots of the Green City ore were said to have yielded over $100 per ton....Many of the mines in the same district, partially opened in 1863 and '64, but since neglected, are now forfeited, the territorial and district laws having not been complied with. Several of those, believed to be the best, are now being relocated. The writer goes on to say that now is the time, if ever, for certain parties who, two or three years ago, expended from two to eight thousand dollars on their claims to act—if they would not lose all that they have done. ....The Colorado mill is being rebuilt. The company have already expended $33,000. They are to crush Techatticup rock on contract..... Six hundred tons of copper ore were at Mineral Hill, and 200 tons at Empire Flat, waiting shipment to San Francisco.

MONTANA.

The Amador *Dispatch* has been shown a letter from a former resident of Fiddletown, written at Grizzly Gulch, Montana, April 26th. We quote:

"Three gulches have been discovered here of great richness, and now producing immense quantities of gold. They are in the Blackfoot country, and known as Elk creek, Bear creek and Keep Cool gulch. I think that there are better mines here than were ever worked in California. On McClellan gulch one claim paid in a single week, seventeen thousand dollars. I know of miners leaving this country, carrying with them six hundred pounds of clean gold dust. Wages here are—for ordinary hands $6 and for good drifters $12 per day."

The Helena correspondent of the *Post*, May 8th, gives these items: The first saddle train of the season, from Walla Walla, arrived here last week.....Trout creek and Missouri river quartz, especially that bearing silver, is attracting much attention All of Mr. Worden's machinery has arrived, and is being rapidly put together on the Cliff extension of the big lead. Colonel Keyser pushes his mill on the same lead, and the Parson's tunnel on the Avant Jour extension of the same lead, which is designed to strike the ledge at a depth of one hundred and seventy-five feet is nearly completed....From the *Post* of 12th inst., we gather the following: There has been within the past few days a brisk stampede to Wigwam gulch, on the Madison slope, about twelve miles from this city. The reports up to date are favorable....The Richmond Hill lode, one of the numerous quartz ledges discovered in Hot Spring district during last fall, assays at a depth of twenty-six feet, $300 per ton.... We have seen some excellent specimens of coarse gold taken from Wisconsin gulch—a locality which has only one fault, in a mining point of view, that of being too near this city to be appreciated as it deserves. Mr. Fairweather, one of the discoverers of Alder gulch, is running a set of hydraulic works, and taking out good pay....All those in Alder gulch, who were ready for a start are doing well, from Summit to Junction, and those repairing damages or starting into their claims are busy and hopeful.

Garnet Lode.—This really wonderful deposit of garnets is in the form of a regular lode—a mass of garnets. As yet the pieces taken out free from fissures are comparatively small, though some will weigh an ounce, when cut. Large quantities have been sent East, and ornaments of the most beautiful kind can be manufactured from them. This is a fine place for mineral curiosities; yesterday we saw in the hands of Mr. Lea. F. Marston, a fine Moss Agate....Correspondent of same paper at Diamond City, says: "New York gulch is attracting a good deal of attention at present, located about twenty-five miles down the river from here. It is about five miles in length. Throughout nearly one mile of the lower end of the gulch, the bed rock is dry, so that the honest miner can at once begin to take out some of the auriferous deposits. Laboring under numerous difficulties, backward spring, no lumber, deep diggings—forty to fifty feet—little money, and shut in by hills and cañons, they are doing well. Quite a number of claims are washing twenty to thirty dollars a day to the hand.; others are almost ready, There is quartz, here and hereabouts, that will yield from three to four thousand dollars to the ton. A better quartz section I have not seen than on the banks of Trout creek and its tributaries. The pay streak in New York gulch is from forty to one hundred feet wide and upwards, and very even. There is also abundance of good timber at hand, and a fine range for stock. The bed rock is shelly slate, standing on edge, and inclined slightly up the gulch. Gold is on the coarse order, well washed, and of a deep yellow color."....German gulch correspondent of same, April 21st, says: Mining affairs are not very lively yet. The weather is very unfavorable, and there is a good deal of snow yet in the gulch. Some snow falls nearly every day, yet the reign of summer is becoming more visible daily....A "Tuolumne boy" has received a letter from a friend in Montana, which contains these words: "I and my partner have got four claims, and in less than a year expect to make fifty thousand dollars apiece. I know no have a fortune in sight. I want you, Bill, to send me up about fifty dollars, if you can spare that much, and I'll pay you mighty good interest on it, sure."....The Dulles *Mountaineer* says there is "scarcely a day that parties are not leaving here for Montana by the way of White Bluffs and Pen d'Oreille Lake; and the testimony of every one of them is that it is a good road, with plenty of wood, water and grass for camping purposes."....The Virginia papers announce the passage through that city of seven men from Montana, bound Californiaward. They say that many others, disgusted by disappointments in that distant region, are on their way back.

NEW MEXICO.

A Santa Fe paper says: The gold excitement is on the increase. Parties of prospectors are leaving town daily to prospect the mountains both near and far. Thus far some valuable discoveries have been made, and the fortunate finders propose to commence work upon them as soon as the necessary arrangements can be made. We hear that some rich discoveries have been made in the vicinity of Fort Cummings....An expedition will start from Santa Fe, on or about the 20th of July of the present year, for the placer gold regions near the head waters of the northern tributaries of the Gila, in the southwestern part of the Territory.

The Denver *News* says: Gold and silver mines of extraordinary richness have been lately discovered near Albuquerque and Lembuda. Trials have been made of ores recently taken out, which yielded from eleven ounces of quartz two hundred and forty grains of pure gold. The mining laws of this Territory allow the discoverer eighteen hundred feet front as his claim.

BRITISH COLUMBIA.

A St. Paul despatch says—"Gov. McFavish has just passed through St. Paul, en route to England. He reports the discovery of large nuggets of gold near Fort Geury in British America, on the lands of the Hudson Bay Co. It has been kept a secret for some time, but the discovery has finally leaked out, and there is much excitement."

Beautiful Extract.—When the summer of youth is slowly wasting away on the nightfall of age, and the shadow of the past becomes deeper and deeper, and life wears to its close, it is pleasant to look back through the vista of time upon the sorrows and felicities of our earliest years. If we have a home to shelter, and hearts to rejoice with us, and friends have been gathered together around our firesides, the rough place of wayfaring will have been worn and smoothed away in the twilight, while the many spots we have passed through will grow brighter and more beautiful. Happy indeed, are they whose intercourse with the world has not changed the tone of their holier feelings, or broken those musical chords of the heart, whose vibrations are so melodious, so tender and touching in the evening of their life.

Thermal Springs in the Reese River Region.—The *Reveille* of the 17th instant has the following:

A small group of thermal springs, lying in the northern portion of Reese River valley, has just been particularly examined by Dr. Blatchly and party, who have returned from an exploration near the Humboldt river. They are situated on the eastern side of the valley, about a mile from the river, and sixty miles north from Austin. The principal springs comprise a group of four, lying within a circle of about seventy-five yards in diameter. The openings or mouths of the springs are generally circular in shape, the greatest of which is about thirty yards in diameter, and the smallest eight feet in diameter. A large volume of warm water gushes from the two larger springs, and it varies in temperature from 110 to 180 degrees. From the two lesser springs only a slight amount of water now feebly issues.

English Patents.—In 1864, 2,024 patents passed the seal. The patents are granted for fourteen years, but nearly seventy per cent. lapse and become void at the end of the third year by the non-payment of the stamp duty of £50 then payable, and nearly ninety per cent. become void at the end of the seventh year, when a further stamp duty of £100 is payable.

About Vinegar.—It was an observation made by Scheele, but the fact has recently been published as a new discovery, that ordinary brown vinegar will keep bright and clear for any length of time if heated to the boiling point for a few minutes.

Metallic Absorption.—By taking up a portion of the metal, snuff becomes poisonous if kept in leaden vessels or wrapped in tinfoil containing lead.

Mining and Scientific Press.

American and Foreign Patents.—Letters Patent for inventors can be secured in the United States and foreign countries through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past two years.

San Francisco:

Saturday Morning, June 2, 1866.

PROGRESS OF THE MINERAL LAND SALE QUESTION IN WASHINGTON.—Neither the House nor Senate Committees of Congress heve es yet mede eny report apoa the hills now before Congress for the sele of the minerel lands. It is thought thet the Senete Committee may possibly report favorably on Mr. Sherman's bill, as ths hill is said to be receivsd in a favnrable light hy the Chairman of that Committee. The House Committee are a unit in their oppositioa to hoth Sherman's and Julien's hills, and helieve thet any further legislation hy Congress in refereace to the mines is annecessary, further thea giving titles to those in possession and who may hereafter acquire e possessory title. They know that the mines are aow productive to the Government, and are es setisfied thet eay legisletive enectments teading to hemper the mines will only kill the goose thet lays the goldea egg. It hes been suggested that when Congress edjourns, soiae of those members who are so desirous of meddling in mining matters shall hs sent to the mining regions to try diggings for a while, to give them some edequate idee, if aot experience, of whnt mines and mining ere when viewed from a different stand-point then the Hell of the House of Repreeentetives at Weshington.

A "BILK."—There is a paper published in San Francisco called the MINING AND SCIENTIFIC PRESS, which professes to give ell the mining news of the Pacific coest. We heve carefully senrched through thnt sheet for the past month, and failed to see one item in regard to the miaes of Oregon or Ideho; while columne ere devoted to the "played out" diggiags of California, Reese River, etc. Tbe miners in this sectioa should set that sheet down as a "hilk".—*Mountaineer, Dalles, Oregon.*

We deny the "soft impeechment." The miners of that "section" will edopt no such recommendntion, unless—contrery to the usnel charecteristics of their class—they should unfortunetely be possessed of as insigaificant, coaceited and selfish minds as the one illustreted hy the above paregraph, which heils from an Oregon *sanctum*. By examining the past nnmhers of the PRESS, they will find hoth Oregoa and Idaho represented in our mining summary, together with "California, Reese River, etc.," and other sectioas (outside of the Dalles) which the generality of miners have the good sense and geaerosity to admit ere aot yet quite "played out." The world has aot yet efforded a single weekly peper large enough to "give *all* the mining news of the Pecific coest."

ANTIMONIAL ORE.—Mr. Screnton, of Gold Rna, Plecer county, hes seent us a sample of eatimony, melted by himself from the ore. The ore occurs in a large mess, rather thnn in a veia or lode, in Humholdt Valley, Neveda. It contains a large emonnt of sulphur, and when heated by a small quentity of wood holds its heet aad buras for a long time. A location wes made by Mr. Scrnnton, ia 1865; hut he wes subsequently driven off hy Indiens. He will suon return and perfect his title.

NEW AUGER HANDLE.—Mr. E. T. Berlow hee ehown as a new auger hendle, arranged with a combiaatioa catch or spriug clasp, for holding the bit or auger in its place, end allowiag it to be readily edjusted. It appears to be a very coaveaient article for those who have much use for these implemeats.

MINING OPERATIONS NEAR MAZATLAN.

We are indebted to Mr. W. A. King for some very valuable informetion with regard to miniag operatioas in the neighhorhood of Mazetlan, Mexico. Tbese mines are located ahout sixty miles inland from the city, end near the hase of the Sierra Madre. They are in what is known as the Concordia mining district, embracing a tract of ebout fifty miles square. We are furnished with the following particulars with regard to a few of the principal miaes:

The Cassandra is an old Mexican mine, but was never worked much. It was forfeited hy its original locators and subsequently denounced by the present owners, Messrs. Burtis of this city, and Mr. Wolfskill of Los Aageles, aow superinteadent of the Alacrans M. Co. There is no machinery as yet upon the mine.

The Alacrans is also an old miae, bat has aow beea opened in a new place by its present owners. It has a very fine plaat of machinery, huilt at a cost of about $125,000 and had just heen started up when our informant left. The compaay is iacorporated in this city—Mr. L. L. Robinson, president.

The Arco is oae of the most celebreted mines of the district. The Arco company, incorporated in Stockton, has three several miaes, tho Arco, the Napoleoa ead the Concepcion. The first has hesn worked by the Spaniards to a depth of ahout 300 feet. The present company erected a mill three years since, and have worked rock chiefly from the Napoleon aad Concepcioa. They were compelled to suspend operations ahout a yeer since oa account of the war; but are aow ahout to resume work again. They will not do much, however, until the conditioa of the country hecomes more settled. The mine is uader the superintendence of Mr. C. C. Castle. The Napoleoa is virtually a new mine, and has heen opened hy a tuanel 200 feet long, opening the mine 300 feet deep. The lode is five feet wide, and easily worked without hlastiag. It is located one end a half miles from the mill. The Concepcion has been worked some hy Mexicens, and is seid to have paid as high as $100 to the ton. The new compeny have not yet done much about opening the mine.

The New York Company have their ageats now et work making ective prcpentioas to build a mill upon the Guadaloupe nnd Secramento mines.

The Trinided Compauy have en old mine, which hes heeu worked very extensively, nnd directly under the city of Copala; have machinery erected on the Parico mine five miles distant. The company suspended work some six months since, on account of the war; but will resume operations again soon.

All the mines mentioned are located within a trect of five miles square, and they are the first mines reached frum Mazatlan. There is no other Americen mechinery ia the district, except whet we have meationed. There ere quite a number of other mines, however, worked hy Mexicans, and a few held hy Americans nad other foreigners. There are also numerous miaes, some not yet loceted, farther up the flank of the Sierra Madre. There is n good wegon road from Mazetlen, forty miles to Sebestien; from that place to the mines—twenty miles—nearly everything is packed on mules; although there was once a passable wagon-road, now aseless by neglect and the effect of the rains. Americaas have no trouble in passiag hack end forth from the sea coast whea attending to their private business. Passes to all such are readily graated through hoth Mexicnn nnd French military lines. As soon as the civil affairs of the country become settled, it is thought that this mining district will hegin to assume coasiderahle importence.

TAKING THE SCHOOL CENSUS.—Persons are now engaged in taking the School census in this city, for the purpose of learning the exact aumber of childrea ia the city entitled to Public School privileges.

GOOD YIELA.—Brown's cemeat mill at You Bet, receatly turaed ont $5,642 from 264 hours' run—withia a fraction of $22 per hour.

KEROSENE OIL EXPLOSIONS.

Three deaths were recently occesioned ia Lowell, Massachusetts, hy the explosioa of kerosene lamps. Such accidents ere of more frequent occurrence than is generally supposed, and so frequent as to render it highly important that some meesures should he taken to guard the public from such danger. Good kerosene will not explode; the explosion of this oil is occasioned hy its heiag mixed with a certain quantity of henzine. Benzine may he either mixed with kerosene efter its manufacture, or it may be mixed in the process of distillation, or rather not perfectly separated from it as it should be. Bsnziae is e much cheaper fluid than kerosene; hence its use in increasing the hulk of the oil. This dangerous mixture grows out of the cupidity of the manufacturer, who seeks to palm off upon the public a cheeper commodity than that which he professes to sell. Every manufecturer has the meens at hand to test the character of his oil, and if he sells kerosene interaixed with beaziae he knows it, and does so with the view of gain, at the imminent risk of the lives aad property of the public. Minerel oils used for illumiaating purposes, are usually tested hy either measuring their iaflammahility by actual tests, which may be readily made; or by determining the density, which may he still more easily doae, by instruments which are or should be in the hands of every manufacturer and dealer.

Explosions occur in this wise: When the oil is heated heyond a certain degree, which is often reached in lamps of ordinery construction, hy the flame of the lamp heating the oil within the lamp itself, benzine is readily converted into e vepor, which, when mixed with atmospheric air, explodes with much violence, precisely like the ordinary illuminating ges. Hence it follows that if any considerable quantity of henzine is mixed with the oil, it will he converted iato vepor, and may find its way out through the vent-holes in the top nf the lamp, and he ignited by tho hlaze. Explosions, however, most frequently occur from removing the top of a lamp which has become heated from long continued burning; in which case, if poor oil has heen used, tho entire interior of the lamp is filled with the vapor of henzine, which coming in contact with a hurning lamp thnt is usually placed neer by to ohtein the light aecessery for filling, etc., is suddenly exploded, often with fatel effect, and always attended with danger.

There is no excuse whetever, bat cupidity, for palming off these dangerous compounds npon the public; but in the ehsence of severe penal enectuents to guard against such practices, it may he well to give a simple test, always withiu the reach of every one, which, although it may not he scieatifically and strictly accurate in results, will aevertheless be sufficiently so to afford a feir degree of protection from the criminal everice of those who value a few dollnrs added to their store more than the lives and property of their neighhors. The following sefety test will answer all practical purposes:

Fill a tumhler three-fourths full of moderately warm water, and then ponr one-half tablespoonful of oil upon it end stir it together; if there is any coasiderable quantity of henzine in the oil, the warmth of the water will cause it to rise in vapor; now hold a lighted metch over it, and if the vapor tekes fire hefore the flame comes in contact with the oil, sead the oil back, as it ought not to be used. Good oil will not thus ignite, aud will not burn even when a lighted match is thrown into it; but most of the edulturated oil will burn freely.

THE GOUGEYE CO., near Red Dog, receatly etarted their new cement mill, which is run by a 24-foot water wheel, driven by water from a 1¾ inch nozzle, with 140 feet of fall. This wheel drives eight stamps of 860 pounds each, at a rete of from sixty to sixty-five drops a miaute. Some very extensive hydraulic diggiags are connected with this claim. A large amount of work has beea done upoa it, aad the claim is considered a very valuahlo one. The owners are A. Tucker, E. Carney, P. Goodspeed, and J. H. Fuller.

ANOTHER CEMENT MILL.—Mr. Thomas McAuley is now engaged in puttiag up a mill for crushing cement upon the Green Mountain claim of Sargent & Jacohs, about five miles north of Red Dog. The mill will consist of ten stemps, with hoisting aad pumping works, to be driven hy a hurdy-gurdy weter wheel. The whole will he completed aad running by the 1st of July. This claim is the most aorth-erly of the five or six miles in length of the series of Blue Lead claims passing through You Bet, Red Dog and Gougeye. The famous claim of Neecs & West is at the southern extremity of the series; while that of Sargent & Jacohs' is at the point where this lead has heen traced farthest north. Beyond that point the gravel range is crossed by Deer creek; hut the hed-rock lies so deep that the precise locality of the Blue Leed cannot he readily escerteined. South of Neece & West the leed crosses Steep Hollow creek, to Little York, end thence across Bear river to Dutch Flat, pessing still farther south across the Americen to Forest Hill, etc. The generel raage of gravel is two or three miles ia width; hut ths Blue Lead proper, which occupies the lowest depression in this gravel range, is oaly from 75 to 150 feet in width. The difficulty of finding this nerrow lead is, of course, very great, except where the revines have cat down through the gravel, so as to enahle the prospector to very readily approximate to the lowest point thereof, where he is sure to fiad the object of his search. The gravel from the Blue Lead is generally crushed in stemp mills, while the halance of the deposit is worked hy the hydraulic process.

CABBAGE STICK.—The latest California novelty was exhibited to us this week, hy Mr. A. K. Beaton, in the shape of a headsome ivory-hended cane, the staff of which wes manufactured from a cahhage stelk of 18 months' growth. This welking stick eppeers to he as sonnd and hard as hickory. It is finished simply with a coat of varnish, end would easily he taken for some rare specimen of real wood. While the plant was growing aeer Mr. Benton's mining cahin, et Gold Run, Placer county, he wrought the initials of his name aad date hy cutting slits in the stalk, which now appear like reised letters and figures. The mild California climete permits this plant to grow perpetually from year tu year, and we hear of ea evergreen cehhage shrub in Los Angeles which is now over eight years of age. A lawyer at Mokelumne Hill has a cahhage tree in hie gerden from which he gathers several heads nanuelly.

QUICKSILVER MONOPOLY.—Ia addition to the monopolies which heve long existed in this State, we have now a "quicksilver monopoly," hy which that indispensable article for carrying on our mining operations hes recently been advanced fully tweaty-five per cent. It nppears that e combinetion of capitalists in this city have managed to correl the entire quicksilver interest of the coast, including New Almaden, New Idria, the Cleer Lake and Guadaloupe mines. As soon as this nrrengemeat wes consummated they advanced the rates to seventy-five cents for home consumption, and sixty-five for exportation, which extortionete prices the miners will be compelled to pay so long es the monopoly can be kept up, or until other productive mines can he found.

WELL SUPPLIED—Dodge & Bro's quartz mills, at Bear Valley, Maripose county, have just heen supplied with the ninth conceatrator, nf the Hendy's improved pattern. The Ophir Mining Co. have also placed an additionel concentrator in their mill, near Newcastle, Placer county. There ere now a large number of these conceatrators in operation in various parts of the Stete, which, we are told, are giving universel satisfaction. Mr. Heudy received a patent for his improvement on the 17th of May lest.

ACKNOWLEDGEMENT.—We are under personal ohligations to Dr. R. Cochran, of Downieville, for favors extended this office. We ere assured he is aa iatelligeat enthusiest in scieace.

THE NORTH STAR MINE, GRASS VALLEY.—Negotiations for the sale of this valuable mine have for some time been pending between the owners of the mine and a party of San Francisco capitalists, represented by Wm. H. V. Cronise, Esq. The sum of $400,000 is said to be the amount which is to be paid. It was expected that the negotiation would have been concluded last week; but some misunderstanding having arisen between the parties, with reference to the contract, it was delayed for a few days for adjustment. The matters of difference having been referred to a third party, have been adjusted in a manner satisfactory to all concerned, and the negotiation will probably be completed the coming week. The North Star is one of the oldest as well as one of the most valuable mines in the State, and in the hands of the new company cannot fail to prove a most valuable mine, even at the high figure named.

PERSONAL.—We had the pleasure, a few days since, of receiving a call from Mr. Chas. W. Harker, of Austin, Reese River, who left on the steamer of the 28th, for New York. Mr. H. goes East for the purpose of endeavoring to enlist capitalists in some mines in which he is interested. Mr. H. has some very fine specimens of ore with him, some of which, from the Dacotah mine on Lander Hill, near Austin, showed considerable native silver, a thing very unusual in Reese River ores. He speaks very highly of the future of Reese River; although he fully agrees with some of our correspondents who hold that too much money has been spent there in building mills, and too little in developing the mines. A mill upon an undeveloped mine is of but little value.

A NEW ROCK DRILLING MACHINE.—A new power drill has lately been put in operation in a tunnel which is being driven for the Massachusetts Western Railroad, through the Hoosac Mountain. At a late exhibition of the capacity of this machine, made before some of the members of the Legislature of that state, it appears that with a horizontal machine, at 30 pounds pressure, a hole 1⅜ inches in diameter was drilled 15½ inches in 7½ minutes; on the vertical machine, 15½ inches in 7½ minutes; on the horizontal again, 29½ inches in 12 minutes. The rock used was granite taken from Rollstone Hill in Fitchburg; the drill striking 200 times in a minute, and advancing one inch every eighteen strokes. The bottom of the drill is nearly in form of a letter X. It is said that Rollstone granite is harder than the stone of Hoosac Mountain.

HEAVY BLASTING OPERATIONS.—The heaviest blast ever discharged on the Pacific Coast, was let off in the hydraulic claim of the American Co. on Manzanita Hill, Nevada, a few days since. The Nevada *Gazette*, in speaking of it, says that a tunnel was run into the hill ninety feet, and a cross-cut of sixty feet was run at the end. This cut was closely packed with 510 kegs of powder, each keg having its head taken out. The tunnel was then closely tamped. The entire hill, 150 feet in depth, 200 in width and almost 300 feet back from the front, was lifted several feet in the air and completely broken up, ready for hydraulicing. The cost of running the tunnel, powder, etc. was about $3,000.

MINING MACHINERY.—The United States *Mining Journal* has an article on mining machinery, in which it says:

In regard to mining machinery there are a few things that ought, by this time, to be among the settled convictions in the head of every mining engineer, among which we might mention: First, that a machine which has not had at home the hardest kind of a test of its powers of endurance is not a safe investment to send abroad to mines. Second, a machine that requires to be driven at a very high rate of speed, especially for either crushing or pulverizing ore, is and must be an unenduring and unprofitable machine. It cannot be durable at hard work, and if taken out to mines, will only go to swell the heap of rubbish accumulated there to the dismay and disgust of mining companies. Third, a machine that professes to combine in one series all the processes from the crushing the rock to the washing of the slimes will invariably prove unsatisfactory.

THE PRESS is a large, sixteen page paper, and is truly a valuable assistant to the mining interests of the Pacific Coast.—[Nye County News.

THE ALTA ON EARTHQUAKES.—The richest thing of the day, in the scientific line, is the *Alta's* editorial of May 31st. It was suggested by the slight earthquake shock of the day before—or at least brought to a head and made to *erupt*, by that occurrence—although its author takes pains to inform us that his "views" are presented only after "the most mature reflection."

The object of the article is to advance the new and astounding proposition that *we have never had any earthquakes here at all;* but that the tromblings "on this Coast"—to quote his own words—"are nothing but thunder storms raging on the surface of the earth." He says that if the shake of last October had been an earthquake, we ought to find a great *crack* at the jumping-off places—say Humboldt on the north, and Santa Clara on the south; and that, moreover, the cobble-stones and sticks and straws in the street, would have been found, after the shock, arranged in circles!

Shall we comment upon this? Has the mantle of some recently deceased savant fallen upon this sage, impelling him, perforce, to "prophesy;" or was some *other* spirit at work when this article was written? Our readers will recollect the shock occurred between three and four o'clock in the morning. *Brains*, (as well as *chimneys*) are sometimes "twisted round" at that hour!

MINERAL PRODUCT OF NEVADA COUNTY FOR 1866.—A correspondent furnishes the Nevada *Gazette* with the following estimate of the gold product from quartz mines in that county for the present year:

Grass Valley Township	$3,000,000
Nevada Township	1,000,000
Other Localities	500,000
Cement Mining	500,000
Placer Mining	4,000,000
Total	$9,000,000

The *Gazette* appears to think the above estimate is not overstated. The item of cement mining we presume is set down as the product of the cement crushing mills, while the gold taken out of the hydraulic diggings, which accompany the cement, is set down as "placer mining."

EARTHQUAKE.—Quite a severe shock of an earthquake was felt in this city and vicinity, about twenty minutes before 4 o'clock on Monday morning. We notice that the Chamber of Commerce, in the published abstract of the proceedings of their annual meeting, have placed upon record, as a fact, that the severe earthquake of the 8th of October last did not seriously injure any building in this city which was constructed of good materials, with proper foundations.

GOLD YIELD IN AUSTRALIA.—Notwithstanding an extraordinary drought, and consequent scarcity of water for mining purposes, the productiveness of the Australian gold fields does not appear to have been checked. The reports from many of the companies show but little falling off. The Custom House returns of the exports of gold since the beginning of this year, give 1,648,693 ounces. The quantity exported last year was 1,725,000 ounces.

HEUSTON, HASTINGS & Co.—This firm have doubtless greater facilities than any other clothing house on the Pacific coast, and seem determined to place themselves still further in the advance, and surpass all previous efforts to please the fashionable public. They have now in process of manufacture by their New York house, under the direction of Mr. Heuston, probably the largest, finest and most stylish assortment of goods ever ordered for this market. Everything novel, elegant and stylish in their line of trade is promised within thirty days after its first appearance on Broadway. By the next steamer this stock of goods will commence arriving.

ANOTHER IMPROVED CONCENTRATOR.—Mr. M. Hungerford, of the old firm of Hungerford & Prater, has made some material changes in the construction of the Prater Concentrator, which he considers important improvements. His card concerning the same appears in our paper to-day. Mr. Hungerford proposes to have the same machine illustrated as soon as a suitable engraving can be obtained.

NEW PUBLICATIONS.

"LAWS OF THE TERRITORY OF IDAHO, relating to Quartz, containing the Quartz Laws, together with all the amendments passed at the last session of the Legislature, held at Boise City, Idaho Territory." Carefully compiled by F. Kenyon, Territorial Printer. Half octavo: 16 pp.

"ADDRESS DELIVERED BEFORE THE SOCIETY OF CALIFORNIA VOLUNTEERS, at its Annual Celebration, April 25th, 1866: by Wm. Gouverneur Morris, of Napa." Octavo: 34 pp.

"MINER'S COMPANION AND HAND-BOOK: By Jas. Silversmith: Author of the Mineral and Agricultural Wealth and Resources of the Pacific States and Territories," and various other handing works. Printed in New York.

The above have all recently been received from H. H. Bancroft & Co.

ON THE WAYS.—The hulk of the old steamship Republic, which used to run between this port and Panama, a vessel of about nine hundred tons, was put upon the marine railway of John G. North, at the Potrero, several days since, to be fitted up for a store-ship for the Oregon and Mexican Steamship Navigation Company. It will be placed in some port on the Mexican coast. This is the largest-sized vessel ever put upon the ways in this city, such sized craft having been heretofore taken to Mare Island for this purpose.

Eyes! Eyes!! Eyes!!!

DR HENLY, OCULIST AND AURIST, HAS received from Scotland one of the MOST MIRACULOUS REMEDIES for the benefit of the HUMAN EYE ever before discovered. It is unparalleled in its effects upon the diseases incident to his organ. It gives wonderful power to the optic nerve, and removes all the granulations from the lids, and all mucous film from the sclerotic coat without the use of instruments. In fact, it works like a charm on the Eye, without giving any pain. You feel the effect of the medicine in different parts of the head. It drives the disease back into the system, which is better able to stand it than this tender organ.
Why will you suffer when you can be cured in a few days. Persons who have been blind for ten years have been restored to their sight in a short time by the use of this medicine. I will treat any person's eyes in the State, and if I do not give them relief in a short time, I WILL NOT CHARGE THEM ANYTHING. Office, No. 751 CLAY STREET, opposite the Plaza, San Francisco. 22-v12

VALUABLE MINES!
FOR SALE
IN NEVADA COUNTY.

FOUR VALUABLE QUARTZ MINES, SITUATED AT THE base of Deer Mountain, and about equi-distant from Grass Valley and Nevada City, are now offered for sale. These ledges run parallel with each other, are wide and well defined, varying from fifteen inches to four feet in width, and have been sufficiently developed to prove them to be of great prospective value. One of them is an extension of the famous Star Spangled Banner. A shaft has been sunk on the extension to a depth of thirty feet, where the ledge is fully two feet wide, and prospects quite as well as the Banner did at that depth. On account of water, further progress downward was impossible without machinery. These claims are accessible at all seasons of the year, and wood and water exist in their immediate vicinity in great abundance. Parties who would prefer putting up machinery and staking on one or more of these claims, for an interest in them, can do so, and liberal terms will be granted by the present owners.
Persons desiring to purchase claims, or erect machinery to prospect the same, will find this a capital chance. For further information, reference may be had on application to the Editors and Publishers of the MINING AND SCIENTIFIC PRESS, 505 Clay street, San Francisco. 21v12

Judicious Resolutions.

Several of our most substantial and judiciously managed mining corporations have passed resolutions, since the approval of the new assessment law, requiring all notice of assessments and sales to be published in the MINING AND SCIENTIFIC PRESS, the only thorough (daily or weekly) mining journal on this coast. Our efforts to concentrate all mining advertisements in one paper, for the economical convenience of shareholders and assessment payers, are meeting with decided success. Those who believe in supporting the mining cause, should bear our paper in mind, and bring up this subject at the next trustee or shareholders' meeting.

San Francisco, April 7th, 1866.
